Atari's window of opportunity will be over by the time the first of the next consoles hits the streets.

The truth of the Jag's future probably lies somewhere between the bankruptcy of Atari and healthy success. I think it will survive for A WHILE into the era of the Saturn/PSX/U64, but like anything in the compuer biz that isn't a huge hit, its days will be numbered.

I think we may be looking at another Turbogfx 16. That unit limped on for a while before disappearing entirely. It was a brave little soldier, the 3rd stringer, but finally succumbed.

Despite the fact that there are woefully few games at this time, I think that the Jag will have barely enough by the time the new consoles come out to establish itself enough to avoid totally fizzling out immediately. So it might last another year and a half or so until it and Atari dies completely. I think Atari's Jaguar II development is mostly a PR lie so I don't expect them to come up with magical hardware to save them from obsolescence anymore than CBM could release AAA before they went down.

The Jaguar was a wonderful ace in the hole for the Tramiels to play to prevent them from going down the crapper, which they were right about to do when they finally decided to give up the home computer biz and cut themselves down to nothing but a shell of their former selves with nothing but the Jaguar as their final asset. This time, unless they get a Jag II, they will have nothing at all to fall back on, and the 90 million from SEGA will run out quickly if Atari indeed spends it on advertisements.

It is a shame because I saw echoes of the 2600 in the Jaguar. And it COULD have been great if the software support had materialized.

So what are the top 19 markets? As for the price, A Sega Genises and a SNES
can be had for under a hundred. If Atari was managed well, the Jag should of
been priced at $150 to make up for a lack of games. This was probably the case
when consumers were comparing the big two and the Jagflop and became aware that
the Jag had a half a dozen games available versus the hundreds on the big two.
The cosumer did not want to gamble $250 on Atari's offering with only six
games available before Christmas.

As for delays by other console company's which one(s) suffered delays
with important products? There was a lack of games for the Jagflop for two
Christmas seasons in a row. I am not aware of any console makers that screwed
up as badly as Atari.

As for my credentials. Yes, I studied Marketing/Management during my college
career. Have you? Doesn't sound like it..

Man. If this isn't proof that you don't have a clue -- among the myriad
other posts by you that similarily prove that you're utterly and hopelessly
clueless -- then I don't know what is.

1) The Jag wasn't designed to compete with the waning 16-bit market. It's
a 64-bit, next-generation machine, and was designed to compete in the
market AFTER people got tired of the toys they had in Genny and Sneeze.
Therefore, a price to compete with extraordinarily inferior technology is a
moot point. Its price point was BELOW what next generation systems were
were at the time -- which consisted only of the overpriced, underpowered
3DO. For technology that is many, many times the power of its inferior
16-bit counterparts, $250 is _not_ a lot to pay. And it's cheaper than any
of the next generation systems out there.

2) No game console is *ever* marketed at a price point "to make up for" ANY
deficiency in software. When you buy a Jaguar, you aren't paying a price
proportional to the amount of software out there, are you? For that matter,
you aren't doing that for any other system, either, are you? Good LORD
you're dense.

: As for delays by other console company's which one(s) suffered delays
: with important products? There was a lack of games for the Jagflop for two
: Christmas seasons in a row. I am not aware of any console makers that screwed
: up as badly as Atari.

The first christmas season was the machine's debut. Did 32X have titles
available for christmas? It had FIVE titles. Five. Which it continues to
have. And you scream about the Jag's lack of titles? THe second season was
due to "growing pains" -- delays from third party deverlopers for the most
part. And that's what I was talking about... not about other coconsoles.
Other 3d party developers dfor the JAGUAR. You've pade quite an art at
putting words into people's mouths -- or twisting the ones they did say to
suit your own weak and pathetic arguements.

: As for my credentials. Yes, I studied Marketing/Management during my college
: career. Have you? Doesn't sound like it..

Looking through community college brochures doesn't count as "studying"

atari.archive.umich.edu has everything ever made for the Portfolio (or damn close to it) in /atari/portfolio

Best way to get there is to gopher to gopher.archive.umich.edu and select option 6 (Merit Software Archives) then go into Atari (option 4) and then down to the Portfolio directory. Other than that, you could FTP there, but it's very busy so you may not get on.

Like it or not, the Jagflop is in competition with the current offerings by
other firms as dictated by the market. I am sure you have covered this in
Principles of Marketing.. As your certion that people are tired of 16 bit
consoles is absurd. Look at the sales of the SNES and Donkey Kong Country as
an example. If and when consumers are tired of the 16 bit consoles, will be
just in time when the Sony PlayStation, the Saturn and possibly the next
offering by Nintendo have come onto the market. These firms have competent
mangement and huge marketing funds that will push what ever is left of the
Jagflop to the sidelines. Like it or not.

>
>2) No game console is *ever* marketed at a price point "to make up for" ANY

I am dense? I remember when the SNES first came onto the market and was priced over $200. Within weeks the price was reduced below $200 because of the fierce competition with Sega's Genises. Like it or not, the Jagflop was/is in direxT competition with the lower power/price consoles and did not do so well. The Culprit: Atari's mismangement, high price and lack of games.

Yes, but Sega owners have a huge library to stay content until the games for 32x pick up steam. Atari had one game for Christma/93 and increased to six for Christmas/94. Can you blame the consumers for hesitation and lack of faith in the company? The buck stops with Atari for not doing an adequate job in supporting their developers with development tools in a timely fashion. Remember the Tramiels are in charge and have not learn their lesson with the Lynx, ST, Falcon, TT, 7800, fiascos...

> As your certion that people are tired of 16 bit consoles is absurd.

I think I am beginning to understand the source of the misunderstanding here. May I have your mailing address, Sinflop? I'm going to send you a book on English grammar and a dictionary. I've got two that are designed to remediate the English errors of second-grade students with hearing impairments.

Here's a thought that may have occurred to you, Sinflop -

* NO ONE LISTENS TO YOU BECAUSE YOU DON'T MAKE ANY SENSE! *

I work with hearing-impaired children and I am not exaggerating when I say that most appear to read and write at a level that escapes your feeble intellect.

And by the way, I don't believe for a second that you have any kind of serious background in marketing or management. You couldn't have possibly graduated with your English skills. At best, perhaps you took (and failed) a buisiness class as part of your GE requirements. Hell, I bet you never even finished your GE! (If you did, it certainly is a blotch on the track record of your purported "University".)

I'll make you a deal. If you can actually state a case against Atari without a single spelling or punctuation error, I'll respond to your post as if you were an intelligent human being. Until then, you're just the laughingstock of the net. Typos are one thing. An utter lack of intellect is another.

And wipe that drool off your face.

JASON

15. 3DO software on PC

17. Atari, and is the Jag "64-bit?"

Newsgroup: comp.sys.atari.advocacy

>
> ~Chrisd

I played with a Jag at "The Incredible Universe" outside of Portland. There was a rather impressive display. Of course, the displays by the other makers (Nintendo, Sega) were more impressive simply because of the walls covered with game carts.

As far as Atari wisely concentrating its resources on one market.... I don't know if ANYTHING Atari does can be considered wise. Granted even if the Jaguar (simply evaluated as a piece of hardware) may be a decent unit, it's always Atari the corporation that is the biggest problem....a problem that has plagued Atari hardware even when that hardware was undoubtedly state-of-the-art at the time. Biggest evidence of Atari mismanagement? Falling from the industry-pioneering dominant giant in its industry to a fledgling with a small minority of the market. Other than sheer incompetance, what else could have done this?

What's with the claims by some that the Jaguar is "not true 64-bit?" "How many bits" a system is appears to be an almost useless piece of information, fogged in vagueness and ambiguity. Of course, "16-bit" refers to the 65816 in the SNES and the 68000 in the Genesis. However, will someone clarify these as true or false:

1) T or F - The Jag is not a 64-bit chip, but two 32-bit RISC chips functioning in parallel. If true, what's the difference in throughput, then?

2) T or F - The "64-bit" refers to the graphics processing power of the Jaguar, NOT the main processor, which is a 16-bit 68000.

Please note that those statements did not originate with me; I simply heard them and I am curious. I know very little about the Jag.

James Wood

18. Test market Jag x 2 xmas seasons???

I do find it difficult to accept that the apparent lack of
Jaguars is only because Atari was "test marketing." Perhaps for
Christmas '93.... but even Christmas '94 I only saw it at ONE store.
Test marketing that long???? When Nintendo and Sega were practically
ramming SNES/GENESIS down Xmas shoppers' throats???

> sorry(not really) that you are too stupid to comprehend..

Sadly, your linguistic difficulties go far beyond typos. However,
I will concede that I've been a bit vicious in my attacks as of late.
What you don't realize (and probably are incapable of understanding)
is that this has nothing to do with Atari save that it is the platform
that you have chosen to vent your misinformed, lop-sided diatribe
against (feel free to ask for clarification if you're having
difficulty understanding any of these words).
Instead, it has to do with this simple fact: you are globally
considered a misinformed, obtuse, ineloquent and fairly uninteresting
person by ALL involved parties. I considered you thus long before I
bought a Jaguar. Your presence does nothing to convince anyone of
anything, excepting the obvious fact that you can behave like a real
idiot sometimes.
It is hard to believe that in the face of such universal dislike
and ridicule, you would continue to post such inane drivel to the net.
Since you apparently lack the common sense to stop posting to usenet,
I am asking you, in no indirect terms, to do so. You'll save yourself
oh-so-much grief.
You seem to take some kind of private glee in Atari's many
shortcomings. That's fine; we've all got to get our kicks somehow. It
makes you just as bad as the Atari "fanatics", though. Such convincing
rhetoric as "get over it" and "the Jagflop will fail" falls far short
of informed argument.
I own a Jaguar because I like it. It's really that simple. I
don't care about "bitness" or "6 games available by Christmas" (which
is, by the way, as nonsensical as everything else you post). I like my
Jaguar. For you to claim (through some prestigitious avenues) to have
knowledge that Atari will fail is absurd. It might happen. It might
not. I assure you that people far more intelligent, educated and
literate than yourself have predicted the success of the Jaguar with
equal ardor. For you to *wish* for the Jag's failure, however, is more
than a little weird; for you to take pleasure in advocating that it
will happen to people who have made an investment in a machine that they
like is just plain penile (you know, penile - like a penis?).
You always draw some brilliant metaphor (ahem) between flaming
you and killing the messenger. The truth be known, you are only a
messenger of your own idiocy. If Atari fails with the Jaguar, and you
are the first to post with the news of their impending bankruptcy,

then you become a messenger. Until then, you are just another voice in the crowd.

I attack your grammar and spelling because they clearly show your lack of education and wit. If your writing skills fail to convince others of your abysmal dullness, your ideas take up the slack. When you start saying something intelligent and propping up you statements with * facts * (again, something you are pathetically short of), I will continue to laugh at you. Since you've demonstrated time and time again that you love making a fool of yourself, I'll be happy to be the banana peel that you slip on until you get tired of this nonsense.

Sleep well,

JASON

I loved especially the christmas tale!

As a footnote to the previous: what makes people defend and attack these
products so vigorously? After all, they are just machines, and after 5 years
they are replaced by new technology. Do you really have to "take a side"
when you buy a certain machine??

Are there guys practising arguing for their political career or what?

22. what atari should have done

Newsgroup: comp.sys.atari.advocacy
Date: 1995-01-04 12:51:13 UTC
From: rappleye@felix.kodak.com
Message-ID: <rappleye-040195073840@150.102.161.162>
Source record: 14070

The 02 January 1995 MacWeek had a small article about the apple set top system which points out some of the major flaws in atari's technical and marketing (?) approach. The apple system will be on the market by christmas 1995, with an anticipated 50+ games...OK, this is hype...they may really only have 25 games at introduction, but a developers conference (does atari have those?) drew 400 attendees, more than double the anticpated turnout.

Technically, the system will be expandable into a full power PC by adding disk drive, keyboard, and mouse. And, here's the real technical kicker, all the set top games will play, unmodified, on regular macs. In addition, current mac and windows games can be easily modified to operate on the new platform.

It seems as if apple has been reading some of the threads around here, these are the exact same things that many of you have been suggesting for atari to do with the jag chipset. Seems like apple knows what to do with a good idea.

Agreed. The ST should have destroyed the Mac and the PC when it
was introduced. A much better machine at a much better price.

: 1) T or F - The Jag is not a 64-bit chip, but two 32-bit RISC chips
: functioning in parallel. If true, what's the difference in
: throughput, then?

False. The Jaguar has FIVE processors .... not two running in
parallel. Two 64bit processors, two 32bit processors and a 16 bit
processor. This is a common misconception. It also has a 64bit data bus.

: 2) T or F - The "64-bit" refers to the graphics processing power of the
: Jaguar, NOT the main processor, which is a 16-bit 68000.

False. The Jag has no main processor. Any one of the five can be
used as central processors.

Tis true. Creative labs has released a hardware upgrade for the PC that will allow it to run 3DO games. Equally of note (though far more useless) is a similiar add-on that allows the PC to run CDi software. I believe this one is not yet out.

> I have, it's not a 64 bit system. READ above, you said it..

Then there is NO True 64bit-computer or 32bit-computer or 16bit-computer!
The PC has and vill forever (probebly) have an 8-bit Keybord-processor, and I
Truly don't Think tha the PowerMac has a 64-bit Keybord-processor either!
So you see, there is no True 64-bit computer! If you think the way you think!

But Loking at it in an other view! You see that the Jaguar is a 64-bit Console!

Chris.

False. The Jaguar has 5 Processors(on 3 differnt chips) 2 of them are 64-bit
2 of them are 32-bit and one is a 16-bit motorala-68k. It uses a 64-bit bus
with 100+megs/sec thouput.

>2) T or F - The "64-bit" refers to the graphics processing power of the

>market. Other than sheer incompetance, what else could have done this?

Remember, the people who owned Atari diring their fall from grace in 1982 are not the same people who own itr now. The ones who own it now are the ones who have kept the company alive for 10 years despite major problems (many of which can be attributed to mismanagement, yes, but bigger companies have fallen and Atari remains. They must be doing SOMETHING right.)

> What's with the claims by some that the Jaguar is "not true

>1) T or F - The Jag is not a 64-bit chip, but two 32-bit RISC chips
> functioning in parallel. If true, what's the difference in
> throughput, then?

False. The Jaguar has the Tom chip, it's graphic sprocessor and sometimes CPU that has real 64-bit components. Jerry, the sound processor and possible CPU is all 32 bit. the 68000, general processor and sometimes CPU is 16/32 bit. the data bus is 64 bit.

>2) T or F - The "64-bit" refers to the graphics processing power of the
> Jaguar, NOT the main processor, which is a 16-bit 68000.

False. Any chip in the Jag can be used as the main processor. However, the graphics processing power is the main 64 bit component. But Tom CAN be used as the cpu as well. the 68000 can be completely "turned off"

> Please note that those statements did not originate with me; I
>simply heard them and I am curious. I know very little about the Jag.

You might want to read R. Jung's Jaguar FAQ.

It depends on where you live. I know of at least 6 stores close to me that
jarry Jaguars, and I've not looked very hard. This is in the Bay Area.

I agree. I live in little Guelph Ontario and there are at least
three stores that carry the Jaguar.

> 1) T or F - The Jag is not a 64-bit chip, but two 32-bit RISC chips
> functioning in parallel. If true, what's the difference in
> throughput, then?

The programmable processing power in the Jaguar consists of two custom 32-bit RISC cores. They are general-purpose microprocessors, and are pretty much identical, except that one has direct access to the sound hardware (it resides on the same chip as the sound hardware) and is thus expected to be primarily used for DSP functions, while the other resides on the same chip as the graphics hardware and is thus normally used for computationally expensive graphics processing. The third processor is a 68000 at something like 13 MHz (the RISC processors are at ~26). The 68000's ordinary role would be to handle jobs the RISC processors shouldn't need to worry about - processing joystick input, calculating object positions in the gaming environment, etc.

> 2) T or F - The "64-bit" refers to the graphics processing power of the
> Jaguar, NOT the main processor, which is a 16-bit 68000.

The Jaguar should really be called a 32-bit machine, though it has a 64-bit data bus. You don't call a Pentium or a PowerPC, both 32-bit processors, 64-bit because both of them support a 64-bit wide data bus; their internal registers are all 32-bit, and their instructions operate on 32-bit quantities (except for floating point numbers). Same goes for the Jaguar.

Others may tell you the Jag has five processors. That isn't quite true. The other two processors are a blitter (aka "object processor") and, as far as I could tell from the Atari propaganda, the video DAC / memory controller section of the graphics processing chip (which contains the blitter, memory control, video output, and one of the two RISC processors). The blitter is supposed to support some fancy ops that go beyond normal blitting, like texture mapping and/or Gourad shading, but it's never been too clear exactly what its capabilities are in this regard, other than that it isn't a truly programmable microprocessor - it operates under control of one of the three microprocessors in the system.

: Sadly, your linguistic difficulties go far beyond typos. However,
: I will concede that I've been a bit vicious in my attacks as of late.

Hey! There's no need to apologize!

: What you don't realize (and probably are incapable of understanding)
: is that this has nothing to do with Atari save that it is the platform
: that you have chosen to vent your misinformed, lop-sided diatribe
: against (feel free to ask for clarification if you're having
: difficulty understanding any of these words).

Great sardonic comment!

: Instead, it has to do with this simple fact: you are globally
: considered a misinformed, obtuse, ineloquent and fairly uninteresting
: person by ALL involved parties. I considered you thus long before I
: bought a Jaguar. Your presence does nothing to convince anyone of
: anything, excepting the obvious fact that you can behave like a real
: idiot sometimes.
: It is hard to believe that in the face of such universal dislike
: and ridicule, you would continue to post such inane drivel to the net.

Yeah, I don't understand it either!

: Since you apparently lack the common sense to stop posting to usenet,
: I am asking you, in no indirect terms, to do so. You'll save yourself
: oh-so-much grief.

Maybe he's a masochist!?

: You seem to take some kind of private glee in Atari's many
: shortcomings. That's fine; we've all got to get our kicks somehow. It
: makes you just as bad as the Atari "fanatics", though. Such convincing
: rhetoric as "get over it" and "the Jagflop will fail" falls far short
: of informed argument.
: I own a Jaguar because I like it. It's really that simple. I
: don't care about "bitness" or "6 games available by Christmas" (which
: is, by the way, as nonsensical as everything else you post). I like my
: Jaguar. For you to claim (through some prestigitious avenues) to have

: knowledge that Atari will fail is absurd. It might happen. It might
: not. I assure you that people far more intelligent, educated and
: literate than yourself

A few messages ago, he babbled something about Iowa State University (or
some such place), but there's no evidence of him being "educated!"

: have predicted the success of the Jaguar with
: equal ardor. For you to *wish* for the Jag's failure, however, is more
: than a little weird; for you to take pleasure in advocating that it
: *will* happen to people who have made an investment in a machine that they
: like is just plain penile (you know, penile - like a penis?).

Great!

: You always draw some brilliant metaphor (ahem) between flaming
: you and killing the messenger. The truth be known, you are only a
: messenger of your own idiocy. If Atari fails with the Jaguar, and you
: are the first to post with the news of their impending bankruptcy,
: then you become a messenger. Until then, you are just another voice in
: the crowd.

: I attack your grammar and spelling because they clearly show your
: lack of education and wit. If your writing skills fail to convince
: others of your abysmal dullness, your ideas take up the slack.

Fantastic!

: When
: you start saying something intelligent and propping up you statements
: with * facts * (again, something you are pathetically short of), I
: will continue to laugh at you. Since you've demonstrated time and time
: again that you love making a fool of yourself, I'll be happy to be the
: banana peel that you slip on until you get tired of this nonsense.

ROTFL!!

: Sleep well,

: JASON

Nice. You went all through a post, got some of the spelling and grammatical errors, and presumably think you've won some sort of victory.

I'm sure I'm not the only onlooker who has become totally exasperated by the increasingly more fatuous comments and flames generated in this thread. Why can't you start resorting to logical arguments?

At the risk of sounding hypocritcal - Shut the fuck up, you cretinous bunch of twats.

There has not been any rumours about Atari porting their TOS operating system to other platforms.

However, there exists a TOS compatible operating system, called Magic, that is, as for now, available for Ataris and 680x0 Macintoshes. A Power PC Macintosh version is already being worked on. As for Power PC Prep from IBM,I do not think they started on it yet. Well, let's make theses machines available first. However, I think one can expect Magic to be ported onto those machines, too.

You can consider Magic the succesor of TOS. It is completey rewriten, several factors faster than Single-TOS, offers true preemptive multitasking and MultiTOS functionality. Available for Ataris at the end of January.

Not to slag the Jag or anything, but how many stores carry Nintendo and Sega? How many carry 3DO? The problem really is not whether the people who really want the Jag to succeed can ferret it out, it's that the competition is SO ubiquitous that the Jag may get lost in the noise. PS, I like the Jag OK myself but it's a little pricy right now and the games are definitely overpriced, IMO.

I couldn't resist responding to this. This is complete bullshit.
Regardless of how illiterate a person is, his/her arguments must stand on
their own merits. They are not affected by the language they are
expressed in, or the person who makes them. The only bearing bad grammar
and spelling can have is if the poor speaking skills result in
misunderstanding. The quote above is a blatant attempt to state that ad
hominem arguments are valid.

It sure is amusing to see talk about credibility when the basis of your
argument is a classic and simple logical fallacy.

I'm not going to say anything about the arguments that Sinclair presents,
but it should be pointed out that many of the posts in this thread attack
him and not the points he's trying to make. That is not a valid argument
technique, by any stretch of the imagination.

Grow up and get a life. I have no idea if sinclair's comments about the
Jag are true or not, but instead of addressing them, all you can do is
moan on about his grammer.

Sounds like a classic case of "misdirection" to me. Distract the
worlds attention from something you don't like by bringing up something
else. (Something which has no impact on the argument at hand)

Either ignore him, rebutt his points, or come up with points of your
own, but don't reduce yourself to making what sounds like purely anal
comments about spelling.

As opposed to what you may have learned in college, you're wrong. Your
boss could misspell all he/she wants, is more successful than you and
could fire your ass anytime.

If you ever corrected me and you were my subordinate, I'd make your life
a living hell until you quit.

Usenet isn't school. It isn't work. It is only important for information
exchange, and recreation. It's an international forum where English is
not everyone's first language.

Also, some networks, like Netcom, are so slow that it is impossible for
the displayed text to keep up with a person's typing, and a delay of 30
seconds or more is not unusual. Correcting your spelling is a waste of
time under such circumstances.

Face the facts, you're an anal retentive snot. Argue the facts and
premises, even the hypothesis of an argument, but don't deny the validity
of an argument based on grammer and spelling. You're not a teacher in a
classroom, and Usenet isn't you're students.

: 68000 at something like 13 MHz (the RISC processors are at ~26). The
: 68000's ordinary role would be to handle jobs the RISC processors
: shouldn't need to worry about - processing joystick input, calculating
: object positions in the gaming environment, etc.

That's talking a lot of cack. The Jerry is a 32-bit RISC DSP; Tom is a
64-bit RISC VLSI chip consisting of three processors (64-bit GPU, 64-bit
BLiTTER, 32-bit object processor). The 68000 runs at 13.3Mhz, while the Tom
and Jerry chips both run at 26.6 _MIPS_ ... not megahertz. The 68000
doesn't have any specific role; the programmers can choose which chip to
delegate to what tasks. The 68k doesn't need to be involved at all if
programmers don't want it to be. Additionally, the 68000 doesn't handle
peripherals (joysticks, etc.) The DSP (Jerry) does, as it contains the
peripheral controller. Calculating object positions is handled by the
object processor (part of Tom). The 68000 is mostly used, if it's used at
all, for game logic -- handling score, time, inventories, creature logic,
whatever.

: The Jaguar should really be called a 32-bit machine, though it has a
: 64-bit data bus. You don't call a Pentium or a PowerPC, both 32-bit
: processors, 64-bit because both of them support a 64-bit wide data bus;
: their internal registers are all 32-bit, and their instructions operate on
: 32-bit quantities (except for floating point numbers). Same goes for the
: Jaguar.

Neither the Pentium or Power PC containm 64-bit processors. the Jaguar
does. Tom can calculate in entire phrases (64-bit) if it needs to, as it
has full access to the 64-bit bus, and the registers do _not_ operate in
32-bit quantities unless you're talking the 68000 (which operates at 32-bits
interally) or the object processor.

: Others may tell you the Jag has five processors. That isn't quite true.
: The other two processors are a blitter (aka "object processor") and, as
: far as I could tell from the Atari propaganda, the video DAC / memory
: controller section of the graphics processing chip (which contains the
: blitter, memory control, video output, and one of the two RISC

: processors). The blitter is supposed to support some fancy ops that go
: beyond normal blitting, like texture mapping and/or Gourad shading, but
: it's never been too clear exactly what its capabilities are in this
: regard, other than that it isn't a truly programmable microprocessor - it
: operates under control of one of the three microprocessors in the system.

BLiTTER handles primarily the mapping of objects on to the screen. All
Atari machines after 1987 contained their own Blitters. And indcidentally,
the RAM controller is part of TOM, and is not listed as a processor, but a
controller. This also holds true for the peripheral controller in Jerry.

Read the Jaguar FAQ; you're obviously totally and greviously misinformed
about the internals of the Jaguar. Better still, I could give you the
E-Mail addresses of a dozen Jaguar developers; they could tell you in great
detail what the inner workings of the Jag is like -- all nice and
honest-like, because they don't, officially, work for Atari.

> That's talking a lot of cack. The Jerry is a 32-bit RISC DSP;

The distinction between a DSP and CPU is very slim. For example, the
PowerPC 601 contains some very DSP-like features, such as a multiply-add
instruction. DSP features are also useful for 3-D graphics processing;
both involve the manipulation of vectors and arrays. It is likely that
the GPU and DSP in the Jaguar are the same RISC core, with more high-speed
SRAM for the DSP so that it has a larger local storage area for
calculation scratch space. (It's much less expensive for them to design
two nearly identical RISC cores than to design truly different
processors. It's also much easier on the programmers if they have to deal
with two instruction sets - 68K and RISC - instead of three.)

> Tom is a
> 64-bit RISC VLSI chip consisting of three processors (64-bit GPU, 64-bit
> BLiTTER, 32-bit object processor).

All non-propagandizing information I have seen indicates that the "GPU" is
a 32-bit RISC processor core. It can do 64-bit data bus transactions to
grab two 32-bit words at a time, but internal registers are 32-bit and the
instructions all operate on 32-bit quantities. (The Jaguar FAQ
carefully dances around this issue. Look at the section where it
discusses whether the Jag is 64-bit or not - only the blitter and object
processor are confirmed to be 64-bit. Since those are dumb devices that
just copy memory around, etc., it's not too surprising that they are
64-bit - a blitter should use the whole width of the bus, or else the CPU
will be faster at memory copy operations than it will.)

> The 68000 runs at 13.3Mhz, while the Tom
> and Jerry chips both run at 26.6 _MIPS_ ... not megahertz.

Notice that 26.6 MIPS is exactly two times 13.3. It is highly likely that the RISC cores in the Tom and Jerry chips run at 26.6 MHz if there is a clock in the machine that's a multiple of 13.3. If the RISC cores are single-issue, which is probably the case, a throughput of one instruction per clock cycle is quite believable. (It's pretty hard to cram a superscalar pipelined processor into one chip of only 750,000 transistors, along with memory control, video DAC, sprite generator, and a blitter, so I think it's a pretty good bet that the Jaguar RISC processors are single-issue with a pipeline of moderate depth.)

> The 68000
> doesn't have any specific role;

Please notice that I said "ordinary role." I did not say that those were the only tasks in the world it could handle.

> the programmers can choose which chip to
> delegate to what tasks. The 68k doesn't need to be involved at all if
> programmers don't want it to be. Additionally, the 68000 doesn't handle
> peripherals (joysticks, etc.) The DSP (Jerry) does, as it contains the
> peripheral controller.

In a machine with a unified address space for all of its hardware, any processor should be able to access the memory-mapped functions on any chip. It's probably quite easy for the 68000 to read the joystick registers on the Jerry chip.

The division of functions into the two custom VLSI chips on the Jag is pretty arbitrary. If they had wanted to, they could have spread the functions out over ten chips, or put them all into one chip. Two was probably just the most economical at the time, and it wouldn't be all that surprising if they shifted to a smaller process size sooner or later and integrated everything onto a single chip, including the 68K (which has only about 68000 transistors, which is why it's named the way it is).

> Calculating object positions is handled by the
> object processor (part of Tom).

The object processor is supposed to handle sprites, text display, etc. Sounds like a form of blitter. It does not sound like a general-purpose programmable processor.

> The 68000 is mostly used, if it's used at
> all, for game logic -- handling score, time, inventories, creature logic,
> whatever.

Exacly what I was trying to point out. I include handling joystick input and calculating object positions in game logic. (Object position meaning where creatures are, where the player is, etc.)

I'd bet that most games do use the 68K. For example, in a 3-D game, if you have the GPU doing all of the rendering, it makes things more

complicated if it also has to keep track of player and creature positions. Easier to offload that task to the lightweight processor, the 68000, and let the GPU handle what is appropriate for it. You might have to use semaphores to coordinate things, but that's probably easier in the long run than making the GPU handle user input and game logic in addition to rendering.

Exactly what I said. Like the Jag, they are 32-bit processors with a 64-bit memory bus.

> the Jaguar
> does. Tom can calculate in entire phrases (64-bit) if it needs to, as it
> has full access to the 64-bit bus, and the registers do _not_ operate in

> interally) or the object processor.

Then why have developers said that the processor registers are 32 bits wide?

There is no compelling reason for the Jaguar's processors to use 64-bit registers and instructions. Mainly because game programming simply doesn't need it: 32 bits of accuracy is plenty for gaming. There is a compelling reason for it to have a wide data bus; this allows the blitter to run quite fast, and provides lots of bandwidth to memory. If the designers were at all intelligent, they probably realized that making one of the RISC cores a true 64-bit processor would do nothing to speed the machine up or make games better, and thus the extra logic used to make it 64-bit would be better spent on other things.

There are obvious benefits to 16-bit over 8-bit, and 32-bit over 16-bit, but until memory technology allows us to exhaust a 32-bit address space and we need more than 32-bit accuracy in games, 64-bit has no real advantages over 32-bit.

You obviously have very little knowledge about computer architecture and
are merely parroting back propaganda. (Just to provide some flame fuel
back. I'm sure you can work with that.)

> Better still, I could give you the
> E-Mail addresses of a dozen Jaguar developers; they could tell you in great
> detail what the inner workings of the Jag is like -- all nice and
> honest-like, because they don't, officially, work for Atari.

I suggest you talk to them more. While a lot of what I wrote is
speculation, it's just extrapolation from known information about the
Jag's architecture. The rest is just ignoring propaganda claims, like
trying to say that a blitter qualifies as a processor.

I have seen posts from developers saying that the GPU has 32-bit registers
and operators. (Admittedly, I can't produce them, since that was while I
still had an Atari, and I didn't save the files when I transitioned to
Mac.)

^^^^^^

I belive there was meant to be a space in "canNOT". This kind of
lapse can not be taken lightly. Had you done this in a typical
public school in 1950, you would have been taken out and horse
whipped. Today nothing would happen to you. The decline of the
quality of the English language is sad. You do nothing but help
this decline by your total lack of concern for your formating and
use of the space character.

>By the way, my degrees are NOT in English. (BS Math, MS
>Information Systems.) Did you ASSume I was some sort of wimpy little
^^^^^^

Mixed use of case in "ASSume" is very non-standard. I was
shocked and taken aback when I saw it. In fact, I feel faint
even now. I can only hope that there were no young people
reading this.

>You are probably right about what you seem to be saying about the

59. Grammar, logic and Sinflop

Newsgroup: comp.sys.atari.advocacy
Date: 1995-01-09 02:43:03 UTC
From: jgillesp@mondrian.CSUFresno.EDU
Message-ID: <D24A7r.AIn@zimmer.CSUFresno.EDU>
Source record: 14010
Cross-posted to: comp.sys.atari.advocacy,comp.sys.mac.advocacy

In the past week, I have seen a number of flames directed at a person who did not start the flame-war against Peter Sinclair. I am the person who started this ball rolling, so if you've got a bone to pick with someone, try me instead.

That said, I'd like to address some of the points brought up in your very mature, logical retorts ("Shut the fuck up", etc.). Thanks to those who had the intelligence and decency to voice their opinions in a more civilized "tone of voice".

In stating that we do nothing to refute Peter's (Sinflop's) arguments by attacking his spelling and grammar, you are absolutely correct. In stating that this argument should have never carried over to the comp.sys.mac.advocacy and comp.sys.amiga newsgroups, you are correct again. I hadn't realized that my usenet replies would be cross-posted to all the various newsgroups. My sincere apologies.

I'd like to believe that logic will win out over illogic in arguments such as this. Sinflop is an unusual species of bird, however. Let me reiterate some of his more recent arguments against the Atari Jaguar:

1. Atari has lost a lot of valuable lead time through hardware and software delays (100% true).

2. Atari is dead.

3. The Jagflop is dead.

4. Get over it.

5. Get over it.

6. Get over it.

No one wishes to argue his first point. His second and third points are nonsense - and impossible to argue, logically, without a operational definition of "dead". Points four, five, and six deserve to be met with the same third-grade rhetoric with which he pollutes the net. His most recent "vision", apparently handed down from the Gods of Significant Console Wisdom:

7. The Jaguar CD is vaporware.

The most logical argument against this would be to cite the people who have seen the CD unit on warehouse shelves; however, Sinflop dismisses this as a "conspiracy", contrived under the wily

supervision of the Tramiels themselves.

People recommend ignoring his immature antics; however, as an Atari owner who knows that potential Jaguar owners may look here for information, his lies and speculation serve to unfairly defame the console. We have tried pointing out his misinformation or his distortions of the truth; he replies with "get over it".

He has gone to great lengths to provoke the negative attention he has received, and seems to enjoy it. I would encourage those people who think that the Sinclair-haters of the net are "anal" or "uptight" take a look at his postings on rec.games.video.atari to see both the extent and the hilarity of his idiocy. I will continue to flame him, albeit only on comp.sys.atari.advocacy, for one reason: the reasonable, non-fanatical Jaguar owners have been swept into the ill-will that he has been spewing at us for the last several months. Anyone with half a brain can see that Atari is sincerely trying to make this console competitive. Maybe they will succeed, or perhaps they will not. In either case, intentionally dishonest, inaccurate, and absurd predictions regarding the future of the Jaguar have destroyed Sinflop's credibility and his welcome here on the net.

Please forgive the apparent inconvenience that his idiocy and our resulting hostility have caused other users of the net. He has a tendency to negatively influence everything he comes in contact with.

Thanks,

JASON

> Agreed. The ST should have destroyed the Mac and the PC wen it
>was introduced. A much better machine at a much better price.

The ST had many short commings compared to the competition (PC, Mac, Amiga). It did not have the expansion ability of the PC (and as far I am aware, they never made any models that had near the level of expansion of the PC and later Macs and Amigas [in excess of 4 full expansion slots with a good selection of supported cards to use]). The OS was better than MS-DOS, but not clearly supperior to the Mac's OS.

Perhaps the greatest problem with the ST is that it did not keep pace with other machines, speedwise. PC's, Macs, and Amigas always had the latest in fast processors. Didn't the ST's operating system have a problem even running on 32 bit chips like the 030? I guess that was finaly fixed in the Falcon, but it was too late by then.

Compared to, say, the Amiga, the ST really had no advantages other than the silly MIDI port (easily added to any machine, and not usefull to the average computer user anyway). Amiga graphics hardware was vastly supperior to anything available at the time (1985), as was the Operating System. The ST was a joke comparatively. If the Amiga people had thought
of putting a MIDI port on the original Amiga, the ST probably would not have even had that market. Even with Commodore's incompetant management (probably one of the worst examples in written history), the Amiga still outlasted and excelled way beyond the ST.

The ST was poorly designed. It looked bad (physicaly), and the OS looked bad. There's no way it could have "destroyed" the Mac and PC or even the Amiga. The Falcon was also very poorly designed.

> False. The Jaguar has FIVE processors .... not two running in
>parallel. Two 64bit processors, two 32bit processors and a 16 bit

You can say some pretty wild things about almost any computer. I could just as easily claim the CD32 has 5 processors as well, but that doesn't really mean much (BTW, they are: CPU, Blitter, Copper, Akiko, DMA engines).

>processor. This is a common misconception. It also has a 64bit data bus.

Parts of it are 64 bit. One of the custom chips can access the DRAM at 64
bits (the graphics chip). The other custom chip, the sound chip, is only 32 bits (it's only a sound processor, 64 bits would be gross overkill anyway). Then there's the CPU, a 16 bit chip (and a rather slow one

too).
Sure sure, it's not the main processor. Whatever. The cartridge slot is also only 32 bits.

Calling the system a 64 bit system is not a "lie", it's just bending the truth a little bit. The stats on the side of the Jaguar's box are not lies, they're just extremely misleading.

> False. The Jag has no main processor. Any one of the five can be
>used as central processors.

Then why, pray tell, do they even need that little 16 bit 68000 chip?
Huh?
Why bother, if one of those 64 bit "RISC" processors could be the CPU?

The Jaguar is going (IS now) to get its butt kicked by 3DO and the other new systems coming out this year.

Of course, it (and the OS) looked better than the Amiga, PCs and Macs, so
who is to judge? The main problem is that the Tramiels (for whatever
reason) wer not able/inclined to update the macine and the OS.

>The Jaguar is going (IS now) to get its butt kicked by 3DO and the other

Of course, the Jag has outsold the 3DO in the US thus far... with little signs
of slowing down.

Sam Tramiel indicated that Atari is:

1) Still manufacturing Falcons in small quantities

2) The long term future of computers at Atari us not yet decided.

3) If a new machine is launched it will probably have the Jag Chipset.

This is straight from the horses mouth.

: The ST had many short commings compared to the competition (PC, Mac,
: Amiga). It did not have the expansion ability of the PC (and as far I am
: aware, they never made any models that had near the level of expansion of

I was refering to 1985 standards with this argument. The ST
didn't need to be expanded, because it had all the things that most PC
users later had to add.

: the PC and later Macs and Amigas [in excess of 4 full expansion slots
: with a good selection of supported cards to use]). The OS was better
: than MS-DOS, but not clearly supperior to the Mac's OS.

Depends on which area you refer to. I found the MAC OS better at
handling memory, but it was hindered by the fact that the OS was on Disc.
Hence, owners of lower Mac systems were plagued by that ridiculous
"Please insert disc ' '" syndrome.

: Compared to, say, the Amiga, the ST really had no advantages other than
: the silly MIDI port (easily added to any machine, and not usefull to the
: average computer user anyway).

That's a matter of opinion. In terms of price, the ST offered
more bang for the buck. The graphics and sound weren't quite as good, but
they still blew away comparable Macs and PCs at the time. The "silly"
MIDI port sold a lot of ST's. In additon, I found the ST easier to use
and prefered the high resolution text display ... much clearer than that
available on Amiga's, Macs or PCs.

Amiga graphics hardware was vastly
: supperior to anything available at the time (1985), as was the Operating
: System.

"Vastly" is pushing it. "Slightly" is more like it. People have a
bad tendency to exxagerate.

The ST was a joke comparatively. If the Amiga people had
: thought
: of putting a MIDI port on the original Amiga, the ST probably would not
: have even had that market. Even with Commodore's incompetant management
: (probably one of the worst examples in written history), the Amiga still
: outlasted and excelled way beyond the ST.

Yes ... thanks to Atari's mismanagment <but that's another
story>.

: The ST was poorly designed. It looked bad (physicaly), and the OS
: looked bad. There's no way it could have "destroyed" the Mac and PC or
: even the Amiga. The Falcon was also very poorly designed.

In 1985? I suggest you check the ST's competition at the time.
Compare it's specs compared to 1985 Macs or PCs. I'll grant, the Amiga
was a winner.

: You can say some pretty wild things about almost any computer. I could
: just as easily claim the CD32 has 5 processors as well, but that doesn't
: really mean much (BTW, they are: CPU, Blitter, Copper, Akiko, DMA
: engines).

I can assure you that the Jaguar offers a hell of a lot more
power than a CD32.

: Calling the system a 64 bit system is not a "lie", it's just bending the
: truth a little bit. The stats on the side of the Jaguar's box are not
: lies, they're just extremely misleading.

The box says "64 bit power with parallel processing". No lies at all.

: Then why, pray tell, do they even need that little 16 bit 68000 chip?
: Huh?

From what I've heard, Atari didn't want to include a 68000, but
the developers it talked to wanted something familiar in the system.

: Why bother, if one of those 64 bit "RISC" processors could be the CPU?

It's called ease of programming.

: The Jaguar is going (IS now) to get its butt kicked by 3DO and the other
: new systems coming out this year.

The 3DO? Sorry ... but I don't see that happening. I like the
3DO, but sales aren't great. The corporation has been in some serious
trouble (by Trip's own admission), and software developers are bailing.
Atari has finally built up some good partnerships and I feel they have a
strong chance of surviving.

Eh? The US has had a population of illiterates since the creation of this
nation. Yes, I am a lousy speller. The Usenet editor does not have a spell
checker. The problem is I have a lot of ground to cover on the usent with a
limited amount of time. I type faster in some cases when the internet
provider's system slows down and creates a lag time.

>
>NOBODY has ANY excuse for being too lazy to use a dictionary. NOBODY!!!!!

It's not being lazy but the time involved. I'd rather use the time of using
the dictionary or the spell checker for written assignments.

>
>Don't you know that a person's credibility, the very validity of their
>argument(s), is virtually *completely* obliterated by the type of grotesque
>illiteracy that you continuously exhibit??????

Yes and No. My credibility with you is zero because you are a pompous ass who
can't refute my arguments. I can understand people's feelings when they convey
their opinions on issues with the use of slang language. Here in the MidWest,
successful farmers communicate with slang language and I am sure many are
terrible spellers and the writing legibility is not upto snuff.

The original 520 TOS was disk-loaded too, remember? (No disk swapping because they just sucked down as much RAM as was needed to load the OS, thereby greatly reducing the free RAM.) A Mac without two floppies was a useless Mac, though. BTW, by no means was all of the Mac OS disk-loaded - a great number of the Toolbox routines resided in the 64 K ROM (which has since grown to 4 MB on the Power Macs!).

A great number of the problems with the Mac OS today are a direct result of the tricks Apple pulled to get around the lack of a MMU in the 68K. Interesting how the neat hacks of yesterday turn into today's boat-anchors so often.

I forgot about the original 520ST! It's been so long since I've
seen one of those 360K detachable drives, that I'd forgotten there was a
520ST out there!

: A great number of the problems with the Mac OS today are a direct result
: of the tricks Apple pulled to get around the lack of a MMU in the 68K.
: Interesting how the neat hacks of yesterday turn into today's boat-anchors
: so often.

Same with the x86 machines. Loading programs in 64k chunks really
slows down the potential speed of upgrades.

I'm an Amiga owner, but I still have to agree with what this guy has to say:-

Mark Rathwell (mrathwel@uoguelph.ca) wrote:

: Depends on which area you refer to. I found the MAC OS better at
: handling memory, but it was hindered by the fact that the OS was on Disc.
: Hence, owners of lower Mac systems were plagued by that ridiculous
: "Please insert disc ' '" syndrome.

I found this a problem when my Amiga 500Plus (a later model) only had one drive. It's fair to say that I would have committed computercide in frustration if I hadn't bought the second floppy (although most of the OS on Amigas except the A1000 is in ROM). The ST had the great advantage that you could run it reasonably well with just one floppy drive, yet still have a halfway decent interface (have you ever seen MSDOS "graphical interfaces" without windows?).

: : Compared to, say, the Amiga, the ST really had no advantages other than
: : the silly MIDI port (easily added to any machine, and not usefull to the
: : average computer user anyway).

: That's a matter of opinion. In terms of price, the ST offered
: more bang for the buck. The graphics and sound weren't quite as good, but
: they still blew away comparable Macs and PCs at the time. The "silly"
: MIDI port sold a lot of ST's. In additon, I found the ST easier to use
: and prefered the high resolution text display ... much clearer than that
: available on Amiga's, Macs or PCs.

I don't know where you get that idea about the display being better, except with a mono monitor possibly. But I totally agree about the MIDI interface- it must have sold a lot of STs- why else would so many musicians have them? If my Amiga had a built in MIDI interface, I wouldn't be waiting to get my hands on one at the moment.

: Amiga graphics hardware was vastly
: : supperior to anything available at the time (1985), as was the Operating
: : System.

: "Vastly" is pushing it. "Slightly" is more like it. People have a
: bad tendency to exxagerate.

Vastly is closer to the truth than slightly. The ST really doesn't have anything like HAM, although I've heard of programs which give you 512 colours on screen (with limitations). But an interlaced HAM screen on the Amiga still holds up amazingly well, even today. That's not counting the

new improved HAM-8 either.

: The ST was a joke comparatively. If the Amiga people had
: : thought
: : of putting a MIDI port on the original Amiga, the ST probably would not
: : have even had that market.

That's True.

: : The ST was poorly designed. It looked bad (physicaly), and the OS
: : looked bad. There's no way it could have "destroyed" the Mac and PC or
: : even the Amiga. The Falcon was also very poorly designed.

As if the PC or its OS was ever any good. It's the marketplace that made
the PC in the main, because of all the clones. That's what made it popular
in the mainstream.

: In 1985? I suggest you check the ST's competition at the time.
: Compare it's specs compared to 1985 Macs or PCs. I'll grant, the Amiga
: was a winner.

The ST was *much* more popular in the UK for quite a while simply because
it was much better value for money originally. About 1990 the Amiga had
taken over as the fashionable machine to own, in much the same way that
the PC clones seem to have done now. This proves that fashion and style
seems to have **** all to do with each other.

Actually, if you compare an ST to a 1985 PC you will get a shock. The ST was a great deal faster, an order of magnitude cheaper, and had much better graphics.

I remember the time vividly. I was looking at the Amiga & ST, but I bought an ST 'coz there wasn't a stable release of the Amiga OS at the time, and they were very over priced (anyone remember the original Amiga? PC style case, desktop that looked grimmer than the standard green ST desktop? Guru meditation?)

The PC's of the time just looked like the CPM boxes that went before them - text displays, noisy, looking generally poor. Then along comes the ST, in what at the time was a quite reasonable case, quite sexy really :) with power, gfx, loads of stuff.....

>
>: the PC and later Macs and Amigas [in excess of 4 full expansion slots
>: with a good selection of supported cards to use]). The OS was better
>: than MS-DOS, but not clearly supperior to the Mac's OS.

And no-one in their right mind would say that the PC architecture was a good one. Thats just not true. The FutureBus+ architecture is a good one - not widely used, but very good : variable bus width (32-256 bit data bus, asynchronous transferrs, multi-cpu with sharing & cache integrity built into the standard).

>: Compared to, say, the Amiga, the ST really had no advantages other than

That's true. The ST Hi-res mode was a better display than a Macs, and better
for serious work than the Amiga - remember, you couldn't buy a colour
DTP system at all, for any platform, so loads of colours was no advantage
for that.

Well, looking in as a more or less impartial observer, I do know that CD technology is really nothing special these days, there's very little to designing, producing, or marketing a CD-ROM unit. So why then isn't the Atari unit on the market? The most likely reasons are:

1. Atari doesn't have the unit designed or built.

2. Atari has the unit designed, but can't afford to build it.

3. Atari has the unit designed and built, but is waiting for an opportune time to release it with a massive marketing blitz.

As an old Atari guy, I've been down this road too many times to get sucked into it again.

Correcting spelling in the Usenet is actually a major netiquette
violation. If somebody starts to correct my spelling or grammar in the
international newsgroups, I will probably start to use some other
language than English. Though the majority of people in Usenet still are
native English speakers, there is a large minority of other
(non-English) people, too. So I think a "communicative" approach to
this matter should be used; as long as everybody (or at least almost
everybody) understands, what one is trying to say, is everything alright.

BTW, did you understand what I meant? :) :)

Well, these would seem reasonable guesses. Truth is, however,
that the units (at least the first several thousand) are sitting on
warehouse shelves collecting dust. Why? Do you know how much flak
Atari has gotten for releasing the Jag before several titles were
ready?
The third-party CD software developers are running one-two months
behind schedule - nothing unusual for a software developer by anyone's
definition. Atari will *not* release the CD until the first five
titles are ready. Everyone at WCES has been talking about how
fantastic these CD games are, and how nice the CD drives look. The CD
drive is not vapor. Even Sinflop has been singing a different tune:
first, he calls the CD vaporware, then he predicts a slightly delayed
release. Believe me, when Sinflop begins admitting that an Atari
product exists, he must have seen it, smelled it, or in some other way
experienced it with his own underdeveloped sensese.

People are saying that Electronic Arts has mailed out a letter to
several Jag owners who requested that EA begin developing for the Jag.
People say that it is extraordinarily good news for the Jag. I have a
funny feeling that Atari is going to be laughing last around here...
Considering that within a five-mile radius, the folling chains are all
carrying and *heavily* promoting the Jag (with kiosks, posters,
banners, etc):

The Good Guys
BRE Software
Toys "R" Us
Wherehouse
Tower Records

I think the cat is poise to pounce.

If not, who cares. My Sega's been sitting in a closet since I got
my Jag, and even if Atari *were* to fail (which I don't think will

happen), I'd still keep this machine around after buying another console because, in brief, I think it's a fantastic machine and I have a lot of fun playing it.

Cheers and thanks for the RATIONAL argument for a change...

JASON

```
: 1. Atari doesn't have the unit designed or built.

Wrong. It's done ... it's the software that isn't written.

: 2. Atari has the unit designed, but can't afford to build it.

With the recent settlement from Sega & Jag sales this Christmas,
that's not likely to be a factor either.

: 3. Atari has the unit designed and built, but is waiting for an opportune
: time to release it with a massive marketing blitz.

Well ... this is Atari, so I doubt it too <grin> ... though
advertising has been improved.

I won't comment any quotes here but I'll have to say I am startled
by the commitment wich so many "well educated" persons have shown
regarding this rather irrelevant issue (I did not catch the
beginning of this tread, so you'll have to have me excused if I'm
missing a point or two here).
Illiteracy is not the same as not being able to develop intelligent
and meaningful idea-patterns:

"... But if we laugh with derision, we will never understand.
Human intellectual capacity has not altered for thousands of
years so far as we can tell. If intelligent people invested
intense energy in issues that now seem foolish to us, then the
failure lies in our understanding of their world, not in their
distorted perceptions. Even the standard example of ancient
nonsense -- the debate about angels on pinheads -- makes sense
once you realize that theologians were not discussing whether
five or eighteen would fit, but whether a pin could house a finite
or an infinite number."

I have to clarify. Only 125,000 has been shipped since introduction over a year ago to Jan1, 1995. So were does the 200,000 come from?

I sure did. BTW, in the spirit of helping you to improve your English,
the phrase in your sentence above should have been "everything is
alright." <G> Oh, and the comma in "understands, what" is not necessary,
and "alright" is best spelled out as "all right."

(This has been an attempt to show a rare example of a constructive
grammar/spelling comment. If this had been a real grammar flame, by now
you would have been doomed to write in the passive voice forever. Please
do not fire up your spellcheckers in alarm; there's nothing to see here.)

Well - actually, I'd be hesitant to classify the x86 segmented memory architecture as a neat hack. It was an ugly munged up way to graft a 1 MB address space onto a 16-bit microprocessor.

The stuff Apple did in software to allow a form of virtual memory without having a MMU to do it with was really quite elegant, but limiting in the long run. They're now making an end run around the old code resource limitations by defining an entirely new way for code to be stored in a PowerPC application, and retrofitting that architecture to 68K code as well.

I think what truly broke Atari and Commodore was the introduction of the
Mac II in 1987. Neither company responded to it for a long, long time.
By the time they did, the window for them to expand into the lucrative
business markets that Apple got into with the II had closed. Atari in
particular was very slothful at releasing a modernized ST; the TT came out
in what, 1991?

The Mac II did a number of things to revolutionize the Mac - it had a high
resolution screen with plenty of colors, a fast (for the time) CPU,
tremendous expansion capability, and an OS whose sophistication was
unmatched.

Atari would have been much better to licence out the Jag Technology to companies in the contries where it didn't have enough money to market it. Foe example give a licence to say make X thousand units in a fixed period of time. This would mean that Atari could have its brand name used in varoius contries and two earn cash for little or no outlay. Therefore if and when the Jag II comes out the machine and brand name wil already be established to a small extent. Then they can if they wish continue to sell the Jag via the licencee or via there own company.

If you've been following this thread for awhile, you'll be glad to know that I am not even going to bother quoting the previous postings on this thread. And, although off topic (didn't Edward Woodward drive a Jaguar in "The Equalizer?"), this article addresses some important points.

In previous postings (dating back at least a full week, from what I can tell), we've seen the involved parties flaming away at each other over unsatisfactory grammar and spelling. The postings I've seen have had almost nothing to do with the topic "What about Atari?"

Admittedly, in a Usenet newsgroup (and indeed, almost everywhere else on the Internet) the only way others can get to know us "personally" is by observing how we get our points across - our "written voice" if you will. Some people have a more refined written voice than others, either because they are more fluent, or they have more time to spend refining their postings.

In the end, the interests of any newsgroup would be better served if more attention were paid to the actual _points_ being made in an article, and not the written voice in which they are presented.

This newsgroup is called "comp.sys.mac.advocacy." Flaming someone for their spelling and grammar (or flaming someone back for criticizing _your_ spelling and grammar) makes no point relevant to this newsgroup. Of course "What about Atari?" is not exactly an "appropriate discussion topic" for this newsgroup either, but couldn't the parties just agree to disagree, or at least take their juvenalia to _private email,_ where nobody else would have to look at it?

Because it can't? Atari has clearly lost the "power for the price" race. Both the DOS and Macintosh worlds can set you up with 60+ MHz Pentium or PowerMac systems at a price of around $2000 US. The Falcon is so far behind in performance it isn't even funny, and it doesn't cost much less than $2K after you outfit it with equivalent equipment, AFAIK.

I don't know what DOS/Mac sells for in the UK, but I doubt the situation is too different for you.

Macs seem to start at abour #600 ukp for a base spec with some free software.
PC's for anything decent are about #700 plus.

My point wa more that Atari had the chance to reduce prices to a
reasonable level and perhaps bundle it with some software and a monitor
and hence compete with Macs's, PC's. Insted it chose to keep the
price too high.

Well, if a company is cash strapped it usually sells of stocks it
needs to get rid of at a cheaper price, so it can raise cash. ATari
could quite easily have done this, whilst also making a small profit
and then used that cash to market the Jaguar.

But there is no point selling something if nobody knows about it. And
telling people (AKA marketing) costs *money* (lots of it, to do it properly).
And AFAIK Atari has already sold off any stock it doesn't want....

There is no way Atari can compete with the PC's and Macs. They sell in
such high volumes that they can be produced for much less than normal.
I think Atari are doing the best thing for them at the moment. That is
concentrate on the Jag (which should do really well for them) until the
computer industry sorts itself out and then maybe come back in with some
competitively priced and good quality kit.

Even if Atari were to go out of business tomorrow, atari machines will
still be used for a long time yet!!

: How familiar are you with Magic? Do you have any idea if it's compatible
: with the GENEVA multitasking application enviroment? I'm using a Mac PPC
: and an Atari Falcon, would love to run some GEM stuff on the PPC. Any
: other info on cross platforming would be more than appreciated!

Magic and Geneva serve the same purpose, ie.replacing parts of the operating system (Geneva) or the operating system itsself. Geneva, in particular, replaces just the AES of the GEM system, Magic replaces not only AES but the whole TOS system. Both systems are competitors and should be reasonably compatible to the original TOS. For example, both Geneva and Magic allow for old applications to run in single tasking mode. Geneva and Mgic should be reaonabily compatible.

As for ypu Mac PPC you still have to wait - Magic Mac runs in its first version only with the old non ppc macs. This is due to the fact that the 680x0 enulator on the PPC does not support an MMU,which is necessary for Magic. Magic thus hast to be rewritten in at least that point in PPC native code, which takes time and even Apple doesn't have the whole of their OS in native code on their own machines. Expect however at the time Magic PPC appears to also have native PPC- GEM applications available.

Regards,

Alfred

: But there is no point selling something if nobody knows about it. And
: telling people (AKA marketing) costs *money* (lots of it, to do it properly).
: And AFAIK Atari has already sold off any stock it doesn't want....

: There is no way Atari can compete with the PC's and Macs. They sell in
: such high volumes that they can be produced for much less than normal.
: I think Atari are doing the best thing for them at the moment. That is
: concentrate on the Jag (which should do really well for them) until the
: computer industry sorts itself out and then maybe come back in with some
: competitively priced and good quality kit.

: Even if Atari were to go out of business tomorrow, atari machines will
: still be used for a long time yet!!

Atari was selling ST's in the high street stores in Christmas 93 and 92.
This was with ZERO marketing. Why then didn't try and shift the
Falcon in the same way?

Answer: They couldn't be bothered, sure it's fine concentrating on the
Jag, but it so far has been to the detriment of EVERYTHING else. Atari
could quite easily have had a full package for #799 including software,
SVGA monitor and a wordprocessor. All the evidence is there a 4mb
Falcon is #399, add #175 for a monitor then #180 for a 65/85 mb
IDE and what do you have #754, then all they have to do is add
in a software bundle say for example, some games and a version of
Atari Works. There you have it, a full system for #799. A system which
in my opinion would compete with the Mac machines. With a bit of
vision and planning Atari could have sold Falcons via the high street
if they had done a little planning. By doing so the money (cash) made
could then be spent on Jaguar marketing. Whats more Atari could
quite easily have avoided actually having to spend any money on
buying in the monitors by simply telling retailers that they can
sell any monitor they like with it, providing it meets certain
technical requirements. Thus retailer could find the cheapest source
by avoiding Atari's markup on the monitors, hence they also make

more cash.

If the Falcon was bundled with decent software which made use of
its CPU, DSP and more advanced graphics then it could quite easily
have been sold via the high street stores. Until Xmas 93 Atari still
had some form of brand name, now it has none depsite the Jaguar. I spoke
to someone recently who said "Atari, do they still exist?", that sums
it up really. Atari really should have tried to sell the Falcon, that
way their name would have reamined on peoples minds, now all we et
is Sega or Nintendo, followed by IBM and Apple.

There was a write up in Wednesday/Wall ST Journal about how Nintendo was able to keep the sales fall off from last Christmas minimal from the previous Christmas due to the success of Donkey Kong Country. There will be another Donkey Kong game for next Christmas. Nintendo sold six million of Donkey Kong Country Worldwide during the holiday period and resulted in increase sales of the SNES.

CDI sales doubled last year to an install base of one million due to popular software titles. 3do did better than expected with retailers in not having enough to sell. Atari was barely mentioned at all and had to do with the Jagflop cdrom.

It was pointed out that the Nintendo U64 will be cartridge based and will be priced at below $250. The U64 will be out next fall. Expect Nintendo to do things right that Atari failed to do with the Jagflop: Nationwide distribution, plenty of games and tens of millions in marketing expenditures. Atari will not have a prayer. Atari failed with the Jagflop in 1994 and '95 will not be any different.

110. WAVETABLE explained - PERIOD!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-01-13 09:50:15 UTC
From: lolsen@hsr.no
Message-ID: <3f5icn$r21@marton.hsr.no>
Source record: 13860
Cross-posted to: comp.sys.mac.advocacy,comp.sys.atari.advocacy,comp.sys.amiga.advocacy,comp.sys.mac.misc,comp.sys.amiga.hardware,comp.sys.mac.hardware,comp.sys.ibm.pc.hardware.systems

As I've said before there is a great deal of confusion regarding
the definition of "Wavetable synthesis" (wich is a method of
reproducing sound) and MIDI (wich is a data protocol).

FM and Wavetable:

FM synthesis techniques generally use one periodic signal (the
modulator) to modulate the frequency of another signal (the carrier).
If the modulating signal is in the audible range, then the result
will be a significant change in the timbre of the carrier signal.
Each FM voice requires a minimum of two signal generators.
These generators are commonly referred to as "operators", and
different FM synthesis implementations have varying degrees of
control over the operator parameters. Sophisticated FM systems
may use 4 or 6 operators per voice, and the operators may have
adjustable envelopes which allow adjustment of the attack and decay
rates of the signal. Although FM systems were implemented in the
analog domain on early synthesizer keyboards, modern FM synthesis
implementations are done digitally.

FM synthesis techniques are very useful for creating expressive new
synthesized sounds. However, if the goal of the synthesis system
is to recreate the sound of some existing instrument, this can
generally be done more accurately with digital sample-based
techniques.
Digital sampling systems store high quality sound samples digitally,
and then replay these sounds on demand. Digital sample-based synthesis
systems may employ a variety of special techniques, such as sample
looping, pitch shifting, mathematical interpolation, and polyphonic
digital filtering, in order to reduce the amount of memory required
to store the sound samples (or to get more types of sounds from a
given amount of memory). These sample-based synthesis systems are
often called "wavetable" synthesizers (the sample memory in these
systems contains a large number of sampled sound segments, and can
be thought of as a "table" of sound waveforms which may be looked
up and utilized when needed).

MIDI:

The Musical Instrument Digital Interface (MIDI) protocol has been
widely accepted and utilized by musicians and composers since its
conception in the 1982/1983 time frame. MIDI data is a very efficient
method of representing musical performance information, and this

makes MIDI an attractive protocol for computer applications which produce sound, such as multimedia presentations or computer games.

For instance, files containing high quality stereo sampled audio require about 10 MBytes of data per minute of sound, while a typical MIDI sequence might consume less than 10 KBytes of data per minute of sound. This is because the MIDI file does not contain the sampled audio data, it contains only the instructions needed by a synthesizer to play the sounds. These instructions are in the form of MIDI messages, which instruct the synthesizer which sounds to use, which notes to play, and how loud to play each note. The actual sounds are then generated by the synthesizer.

The General MIDI system specifies which instrument or sound corresponds with each program/patch number, but General MIDI does not specify how these sounds are produced. Thus, program number 1 should select the Acoustic Grand Piano sound on any General MIDI instrument. However, the Acoustic Grand Piano sound on two General MIDI synthesizers which use different synthesis techniques may sound quite different.

In light of this it's apperant that neither the Mac's sound-system nor any other standard computer platform use Wavetable to reproduce sound. _Some_ of the principles _may_ apparently look similar - this doesn't, however, make the Mac reproduce sound with wavetable.

Cheers...

111. Positive Amiga info?

Newsgroup: comp.sys.atari.advocacy

William D. Simpson (wsimpson@mailer.fsu.edo) kindly wrote :

: Amid all the negative words we hear about the Amiga platform these days
: it was enlightening to run across this tidbit of positive reporting:

: (From Computer Video Nov/Dec 1994, pg 14 an article entitled
: "Does Unix Have a Place on Your Desktop?" by Daniel
: Rappaport...hope this isn't too much a copyright
: violation.)

: "The case of the Amiga is interesting. It enjoys the most
: UNIX-like operating system among personal computers. Consider its standard
: features: true pre-emptive multitasking, multiprocessor capabilities, both
: a GUI interface and an optional command line Shell, as well as an extensive
: command set and filing system that clearly borrowed heavily on UNIX.

: It is also well known that most Amiga users are in the process of
: migrating to other platforms. An Amiga user who is expert with the internals
: of AmigaDOS will be appalled by the crudeness of MS-DOS or stifled with
: the lack of command line in the Mac Finder (not to mention the lack of
: any hint of multitasking). Former Amiga partisans may want to seriously
: consider moving on to a UNIX platform."

Then Paul Thurrott (thurrott@ix.netcom.com) wrote:

: Positive journalism is just as dangerous as negative journalism. I
: prefer HONESTY. The article you quote was obviously written by an Amiga
: fantic like most of us in this group. I suggest we meter any glee we
: feel at the potshots that author takes at MS-DOS and remember where we
: stand in the world of computing - right next to Atari. Not a pretty
: view, is it?

And this is my opinion :

If not driven to extremity I'll have to disagree a little -
"HONESTY" isn't always the clue to good sales.
Take a look at the PC world about 8-12 years ago. Better hardware
and software-solutions did exist outside IBM/Microsoft - and
I'm pretty sure they knew.
But, good marketing, gentle persuasion and based on peoples
uncertainty/ignorance, look what happend - well over 100
million PC's have been sold today..... 8-)

Cheers...

Do you really believe such a stupid claim? The TT _had_ a 030, and surely
TOS ran on it (v. 3.0x), the MegaSTE TOS 2.06 also runs on 680x0 machines,
at least up to 030s. The TT was out at the same time as the A3000.

And PCs having the latest in fast processors is good for a laugh. Up to
1988 the vast majority of PCs was _slower_ than all 68000 machines.
This changed with the introduction of the 80386, not earlier.

>Compared to, say, the Amiga, the ST really had no advantages other than
>the silly MIDI port (easily added to any machine, and not usefull to the
>average computer user anyway).

Retargetable Graphics, SM 124, ability to run the machine with one disk
drive (and this _was_ an argument in the eighties), plus the software
advantage in some areas (Signum was unique when it came out, e.g.).

>Amiga graphics hardware was vastly
>supperior to anything available at the time (1985), as was the Operating
>System.

Yes, of course :-), at times when a 10 meg HDD cost more than 1000 US$, it
surely was an advantage to load anything from disk. Machines with half a
meg of RAM are predestined to run many applications at the same time in
preemptive multitasking :-)...

> The ST was poorly designed. It looked bad (physicaly), and the OS
>looked bad.

Kick 1.x is the worst visual impression among OSes available.

>There's no way it could have "destroyed" the Mac and PC or
>even the Amiga. The Falcon was also very poorly designed.

Of course :_)))))))), that's why national sales of the ST were much higher
than those of the Mac for many years.

And that is a lie. 1991 was _one_ year after the TT, the same year when
the MegaSTE came out. If I remember correctly, the 040 wasn't even
finished by Motorola.

: in stock, though it would have been a good idea.

According to many people Atari allegedly had a large inventory of
Falcons. If this was the case they could quite easily have shifted
them over Christmas. The Falcon if bundled correctly (ie with monitor
& software) can quite easily compete with low/mid range PC's and Macs.

My point was that it is quite possible to sell Computers without needing
to resort to millions on avertising indeed a relatively small budget
if done at a critical time (xmas) will suffice. Indeed I'm not sure
about advertising in Magazines but a few years ago Page 6 charged
around #1300 for a full page add in NAU. Even if you multiply this by
6 (magazines) and over 12 weeks then times it by 3 (for safety) you get
about #280k. If Atari spent the same again on other forms of advertising
they'd get a reaonable campaign for the Christmas period, as well as
sales to match (provided they had the Falcon at a sensible price). Say
they make #150 on each bundle they need to sell 56500 units to make
any cash. This is 1/5 of what the Amiga sold in one year!!

If they then followed this campaign up with literature and sales in
the retail channel, then kept a small add campaign for the rest of
the year, they'd do quite well.

The right way to do it is to have your HW and SW ready to go at the same
time. You pick the time and have all (or at least most) of your associate
developers deliver with you. Atari never had enough developers in the
first place, so when some of them failed to deliver, the entire effort was
unsuccessful. The developers see the success of the platform and initial
games, and are encouraged to write more games, thereby lengthening the life
of the platform.

In the case of the original Jag, there weren't enough games at introduction
and there still aren't. Given the relatively short lifespan of a gaming
platform, Atari's failure to have a total suite of HW and SW on the market
is nothing short of suicidal.

I am not sure what you mean by the "standard platform", but there are
several PC sound cards that use wavetable synthesis. October '94 issue
of Windows Magazine reviews 16 of them.

I personally have the SB AWE32 card that uses wavetable synthesis. It
has a built in 1MB ROM to store standard patches (General MIDI, MT-32,
and GS (I think). It also allows for downloading custom patches.

: There was a write up in Wednesday/Wall ST Journal about how Nintendo was able to keep the sales fall off from last Christmas minimal from the previous Christmas due to the success of Donkey Kong Country. There will be another Donkey Kong game for next Christmas. Nintendo sold six million of Donkey Kong Country Worldwide during the holiday period and resulted in increase sales of the SNES.

: CDI sales doubled last year to an install base of one million due to popular software titles. 3do did better than expected with retailers in not having enough to sell. Atari was barely mentioned at all and had to do with the Jagflop cdrom.

: It was pointed out that the Nintendo U64 will be cartridge based and will be priced at below $250. The U64 will be out next fall. Expect Nintendo to do things right that Atari failed to do with the Jagflop: Nationwide distribution, plenty of games and tens of millions in marketing expenditures. Atari will not have a prayer. Atari failed with the Jagflop in 1994 and '95 will not be any different.

Hey Sinflop ... you originally predicted Atari's bankruptcy by January 1995. Atari is still with us.

Yeah ... Donkey Kong Country sold well ... it's a good game. However, 6 million copies still means that the majority of SNES owners around the world did NOT buy this flagship game. Second, you didn't list how much SNES sales were increased. The Jaguar sales increased when AvP and Doom came out too.

Third, the CD-I has been out for several years and struggled to get to that point. Fourth, Atari has also spent tens of millions on the Jag. Their not as in trouble as you seem to think.

Six million in two months!! I wonder what sales would be like in 12 months.
Jagflop sales were miniscule. Atari announced last September that 95,000
Jagflops shipped worldwide. This week, an Atari Vice President of marketing
was quoted that Atari's install base of Jagflops worldwide increased to 125,000
worldwide. So, Atari sold about 30,0000 Jagflops in the Christmas period.

Not quite true. Quick Time 2.0 has a large library of wavetables
that Apple licensed from a large MIDI company. I don't recall the
companies name, but they provided all the instruments that come
with QT 2.0.

Of course the Macs also does four channel stereo sampled sound.
The Mac does not do FM, but cards are available to do so.

Two points:
1) The operative statement was essentially "The Mac doesn't do wavetable."
But with QTMI, it does.
2) QT does not do MIDI out to an external device. It allows those
applications coded with MIDI sound to reproduce those sounds on the
Mac. Same general idea as using a wavetable card on a PC.

I hope Atari's move into VR and modem peripherals for the Jaguar helps stimulate sales. Atari has some fantastic technology but they need to get the word out. Great games for the Jag (at least I'm enjoying them!)

Of course the Macs also does four channel stereo sampled sound.
The Mac does not do FM, but cards are available to do so.

The Mac does FM synthezis. Not many recent apps that use it though.

What is your definition of "better?" In the eye of which beholder is such a subjective judgement to be made? In 1985, for **MY** purposes, the Atari ST presented a "better" hardware/software solution to **ME** than any PC solution would have done at the time. I cannot, nor shall I attempt to, evaluate nor speak for the reasons why PC buyers at the time made their choice. It seems senseless for someone to look back on times that have passed and label the development to be "based on people's uncertainty/ignorance." Such judgemental speculation has little basis in fact, and is actually irrelevant. Perhaps early PCs DID offer the users the "best" solution. Who knows? Who cares? The fact is that **NOW** the PC offers the best value in terms of bang for the buck that has ever been offered - in terms of hardware and software. It was only after that fact that I switched to the PC platform. As soon as some other platform gets to that point (could be Power PC in the future, could be '686 in the short run), I'll switch to that platform. I just don't understand how people can become so "loyal" to any particular platform or brand. Whether its a computer, automobile, or whatever....I simply buy whatever looks good, works good, and represents the best value. When it comes time to upgrade, I don't care what brand or "platform" it is, if it satisfies those requirements.

If you read Inside Macintosh: Sound, you will find the Sound Manager can play 3 kind of sound 1) square-wave 2) wave-table 3) sampled-sound. You can goto the index and look up wave-table. QuickTime require Sound Manager.

The speech manager also looks like some form of wave-table to me. The wave table is a table of phoneme and by using difference voice file, you can have male, female or robot etc. You can even change pitch, prosody etc for one set of phoneme. There is over 20 voices file on ftp.support.apple.com. Some sounds like singing, whisper etc.

Sound Manager is part of all macintosh for years now. System 7.5 come with QuickTime 2.0, the QuickTime Musical instruments and Speech Manager. There are all part of the Mac now.

>
>Oh? What would you call QuickTime Musical Instruments? Sure looks like
>a wavetable to me...

As much as I dislike the QuickTime 2.0 sound quality, I'd have to agree. Even pre-QT2.0 Macs had a note synthesizer tool (software) that relied on sample data to create music. On the PC side, if one considers the SoundBlaster digital audio, one could even argue that MOD music players used a form of wavetable synthesis...ditto for the Amiga, which fathered the MOD format years and years ago. Consider also the Apple IIGS actually had an Ensoniq 5503 digital oscillator chip built-in to the machine (1987), which certainly used the wavetable techniques that Olsen mentioned. Any computer with a digital sound output can implement "a table of sound waveforms which may be looked up and utilized when needed."

Of course, the QUALITY of computer-based wavetable leaves something to be desired compared to professional wavetable products, though you can add them on to your PC if need be.

Perhaps the distinction is being made based on hardware implementation, or more accurately the division of labor between computer and tone generator.

From a generic hardware point of view, both the Mac and dedicated wavetable synthesizer maintain a store of samples and some method of accessing them. I wouldn't be surprised is modern wavetable synthesizers used DSPs and other microprocessor logic to control sample looping, filtering, and interpolation.

From the division of labor point of view, the overburdened Mac has to both playback MIDI data, interpret, AND synthesize sound. This is not as ideal as having a dedicated MIDI synthesizer purring under the hood. With the Mac QT or Note Synthesizer approach, you

1) Lose execution speed. I know, I know, Apple says "The PowerPC chip is powerful enough to do that and also run your programs!" However, that 10-20% hit in CPU could have been giving you a faster framerate instead.

2) Lose sound quality. You could probably program a PowerMac to sound
just as good as pro-quality wavetable synth, if that's all it had to do.
If you have to let other programs run, you're going to have to sacrifice
some features...it may be polyphony, sample rate, or timing resolution.

Well, i guess i have to come out of the closet, yes...i was an amiga fanatic about 5 years ago. The machine was a good idea, but good ideas ain't enough. Would i migrate to unix? geez, i've spent 20 years in the business and unix is still here...why? apparent portablility and the C language me thinks.

The best o.s. i've used was VMS on vaxes. It was the only system i could write system/driver level code and not have to debug with an osiliscope. They had the greatest crash tool. Instead of just rebooting, you'd get a dump with a really good diagnostic tool to analyse it with. The biggest problem i saw in the amiga was the attitude that if your program crashes because there's no way to protect against using too much stack, then tough, its your fault. So programs crashed easily because there was no protection. Also, they didn't have a toolbox like the mac. Lesson: multitask without protection your gonna get lots of agravation. So every time anyone tried an amiga, you'd end up with a dumb red box saying "guru meditation" or some such nonsense.

I've switched to macs for my desktop and i access unix files using nfs (i still have 1 amiga with its own internet address running nfs for text editing - beats VI anyday) but my friends tell me that the o.s. that will win in the next few years is windows nt. Why? because it runs all those windows and dos things and was built by the same guy who was the cornerstone of the VMS o.s. (WNT = VMS + 1 as in ibm=hal+1). I think WNT was microsoft asking Cutler to build a newer and more portable vms. Some tell me he was successful. I'm gonna buy the book soon. Hear its better than soul of a new machine. (i programmed nova's and pdp11s too, gad i'm getting old...)

National sales != U.S. sales. I can assure you that I am not a citizen of
that country, not even a resident. And you have heard that there are other
nations around, right?

>You did say "many" so I would expect this was not an isolated incident.

Yes, 1986-1989, I presume. I threw away all my old magazines of that time,
but sales statistics for Mac were...errrr...not worth mentioning in
Germany (yes, that is from where I write) up to 1992, when Apple finally
decided to lower the prices dramatically.

You are assuming a large % of cpu time is need. I don't think it will be
that large. What if it only take <2%? I don't know what the % is now but
PPC is getting faster and faster. Even if it take 20% today, it will
become 5% in a year.

Again what if it only take a small % of cpu time to get pro-quality
output? Sure sound chip is nice, but I want another PPC in the box much
more. :-)

(Sorry follow up my own post)
Don't forget QuickTime can play MIDI music on 68K machine too. So the
performance hit on PowerMac should be minimal.

You should've paid more attention to what you quote - what I said
was "_standard_ computer platfor_m_"....

: STOP BEING SO PEDANTIC.

Hmmm...I honestly thought that resorting to "child-language"
was not necessary when explaining on the net....og well, here we go.

The word "Wavetable" seen as a sort of standard, you know, here
in "music-land". The Macintosh can maybe do a little _w_avetable
juggerly (as I have said maaaany times before) but it is not by
faaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaar
good enough for us you see (the standard PC/Atari/Archimedes/Amiga
can do this too).

I'll give you _the_ problem : I want to play my G-MIDI composing on a
standard Mac.
It's a standard G-MIDI file of a 32 polyphony song with multiple
seemingly simultaneous effects including something like ; echo,
time-stretch, phase, flange, reverb, crossfade and chorus with
at least 95db dynamic range (note I did not say s/n ratio, but
this should at least approach 89db - wich is accepted in a studio).
If you can show me a way - even theoreticly - of doing this on
a bog standard Mac I'm yours (because this would mean I could
throw my Wavecard away)....
I am able to do this on a PC with a Roland-card (accept for the
s/n ratio wich needs a little "tweeking" - PC's are a little noisy).

Is this simple enough? I hope I don't have to explain this again.
Cheers...

I agree with the honesty aproach. The top statement is true, but some of the crap that UK amiga magazines spout makes the Amiga community look bad. Amiga Shopper this month told a reader that the reason there were 60 pound 24 bit cards for the pc, was that all they were was frame buffers, using a comparison to using operators in ADPro, where you dont see what you are doing until you render. My friend has a 50 pound trident card and it does 24 bit in 640*480 no problem in windows. I have a 150 pound Orchid

Kelvin 64, which is very fast i 24 bit 800*600. Hardly frame buffers, and alot cheaper than my 320 pound picasso II, and faster by miles (not to mention supported). Lies like these in Amiga press are frequent, and look bad.>

Er, I should've typed _W_avetable.

: Two points:
: 1) The operative statement was essentially "The Mac doesn't do wavetable."

Eh no, it was rather something like the Mac doesn't do _W_avetable
wich is considered a musical standarisation of Wavetable sound...

: What is your definition of "better?" In the eye of which
: beholder is such a subjective judgement to be made? In 1985, for **MY**
: purposes, the Atari ST presented a "better" hardware/software solution to
: **ME** than any PC solution would have done at the time. I cannot, nor
: shall I attempt to, evaluate nor speak for the reasons why PC buyers at
: the time made their choice.

Largely because quite many of them didn't know they had a choise.
I've seen firms spend 10's of thousands of dollars on PC's
(or in some cases Mac's) wich really didn't answer their
requrements - they could (at the time before anyone really knew
wich trend would be dominant) have been much better of with another
brand.

: It seems senseless for someone to look back
: on times that have passed and label the development to be "based on
: people's uncertainty/ignorance." Such judgemental speculation has little
: basis in fact, and is actually irrelevant.

Well of course it's irrelevant today - the point is "what can
we conclude from this?".
Still today the average consumer has at best minor knowledge of
computer technology and software - the future of computer marketing
may have something to learn from paying attention to this.

Cheers...

>finaly fixed in the Falcon, but it was too late by then.

The problem with the o/s was that it used instructions in user mode that are only available in supervisor mode with the '020 and later chips. This was fixed much earlier than the falcon; TOS 2.0x works (it actually came out after TOS 3.0x on the TT), and IIRC TOS 1.04 did even earlier.

> Compared to, say, the Amiga, the ST really had no advantages other than
>the silly MIDI port (easily added to any machine, and not usefull to the
>average computer user anyway). Amiga graphics hardware was vastly
>superior to anything available at the time (1985),

It was superior to the ST's, but not by much of a margin; and the Amiga lacked the (admittedly mono) high res mode of the ST.

>as was the Operating System.

The Amiga's o/s was powerful with nice multitasking etc; the user interface on top wasn't as easy to use nor did it look as nice (later versions are quite nice admittedly, but in '85 and for quite a few years thereafter the amiga was nowhere near as nice to use as the atari) (IMO of course)

>have even had that market. Even with Commodore's incompetant management
>(probably one of the worst examples in written history),

Worse than atari's?

> The ST was poorly designed. It looked bad (physicaly),

Maybe, but hardly any worse than the amiga.

> and the OS looked bad.

As I've already said, I can't agree with that

> There's no way it could have "destroyed" the Mac and PC or even the Amiga.

When it was released it was faster and had better graphics and sound than all but the most expensive PCs. With better marketing and more importantly, with continued development, it could have at least taken a large market share off

the PC or the Mac. As could the amiga of course, neither machine was marketed well and both were superior to most PCs at the time.

> The Falcon was also very poorly designed.

In many ways I would agree with that; using a 16 bit data bus, and only clocking the processor at 16Mhz were stupid decisions, presumably cost cutting. Not having an expansion slot (there is one, but there's hardly any space for a card, and it's different to the one in the TT and MSTE) was also a bad decision, which they justified by using the same case (why? Why not the TTs case?)

>> False. The Jaguar has FIVE processors .... not two running in
>>parallel. Two 64bit processors, two 32bit processors and a 16 bit

>You can say some pretty wild things about almost any computer. I could
>just as easily claim the CD32 has 5 processors as well, but that doesn't
>really mean much (BTW, they are: CPU, Blitter, Copper, Akiko, DMA
>engines).

I don't know about all of those chips, as I don't know the details of the cd32's architecture; the jag has three real general purpose CPUs and two which while atari count them as processors I think most people would not.

>anyway). Then there's the CPU, a 16 bit chip (and a rather slow one
>too).

It's fast enough for it's purpose.

The jaguars architecture (lots of different chips, with the main processor fairly slow) is great for games, less so for serious applications, which is why I hope they don't try to make a jaguar computer (I don't believe they will but there were rumours of it)

>Then why, pray tell, do they even need that little 16 bit 68000 chip?
>Huh?
>Why bother, if one of those 64 bit "RISC" processors could be the CPU?

To offload the game logic from the other processors allowing them to concentrate on the graphic

Not the 3dO; it's already outselling it despite them having been available a similar amount of time. The new systems are a great threat to it as many of them are technically superior, and have more marketing muscle behind them as well.

Sorry to be a bit off topic, I've read somewhere that Roland and Apple have agreed to put General MIDI sound chip which is used in Roland Sound Canvas series in future Macs. If this becomes reality, we'll finally be able to reproduce high-quality sound without add-ons!

Now, anyone know when this happens?

Satoru

Actually Apple is a minor player in the European home market anyway. And
before sinclap comes back with his 'they had 2 billion sales in Europe
alone' that means shit when you look at what the clones did over the
same period.

Speaking for the Netherlands, I am a firm believer that one could draw
a parallel between modem use and home market penetration. Overhere
PC's have 80% of the modem market, Amiga 12%, Atari 4% and Mac 2%..

aric r caley (dances@qedbbs.com) wrote:
: > Agreed. The ST should have destroyed the Mac and the PC wen it
: >was introduced. A much better machine at a much better price.

: The ST had many short commings compared to the competition (PC, Mac,
: Amiga). It did not have the expansion ability of the PC (and as far I am
: aware, they never made any models that had near the level of expansion of
: the PC and later Macs and Amigas [in excess of 4 full expansion slots
: with a good selection of supported cards to use]). The OS was better
: than MS-DOS, but not clearly supperior to the Mac's OS.

Back then all the expension slot were for was Serial port, Parralelle
port etc... when you look at the ST whatever you need to add to the PC
the ST had it. That's why their is no need of expansion slots.

: Perhaps the greatest problem with the ST is that it did not keep pace
: with other machines, speedwise. PC's, Macs, and Amigas always had the
: latest in fast processors. Didn't the ST's operating system have a
: problem even running on 32 bit chips like the 030? I guess that was
: finaly fixed in the Falcon, but it was too late by then.

: Compared to, say, the Amiga, the ST really had no advantages other than
: the silly MIDI port (easily added to any machine, and not usefull to the
: average computer user anyway). Amiga graphics hardware was vastly
: supperior to anything available at the time (1985), as was the Operating
: System. The ST was a joke comparatively. If the Amiga people had
: thought
: of putting a MIDI port on the original Amiga, the ST probably would not
: have even had that market. Even with Commodore's incompetant management
: (probably one of the worst examples in written history), the Amiga still
: outlasted and excelled way beyond the ST.

Not true, for a long periode of time Amiga didn't have any software
except for graphic and sound sampling. On the other hand Atari had all
the software you need for a home computer and for a ridiculous price.
Even though the software price was low, there were a lot piracy and I
think that might kill the ST since the publisher stopped to produce their
program on the ST first. As long as the MIDI is concerned, back then
nobody has the MIDI not even a extension card. When they finally came out
with the MIDI card for the Mac or PC it costed thousand of dollars. Why
do you think that the ST is so popular in the Music world?

: The ST was poorly designed. It looked bad (physicaly), and the OS
: looked bad. There's no way it could have "destroyed" the Mac and PC or
: even the Amiga. The Falcon was also very poorly designed.

It is a question of taste.

Fair assesemnt, QT adds midi wave tables to the Mac.

>2) QT does not do MIDI out to an external device. It allows those
> applications coded with MIDI sound to reproduce those sounds on the
> Mac. Same general idea as using a wavetable card on a PC.

I suspect the QuickTime team will be rather shocked to hear this.

If you are plugged into a MIDI device it will make full use of
it, but if not, it will fall back to it's built in sample library.

I know this for an _ABSOLUTE_ fact. I've seen it, and at length
questioned the QuickTime MIDI lead.

QuickTime _FIRST_ tries to find hardware which it will use. If
it can't be found it will fall back to software.

This means if you have a super graphics card, it will make full
screen 30 frame a second smooth video, else it will do a poorer
software version. But it will always get done.

People always rag on how slow QuickTime is, but they forget that
as 3rd parties and Apple ship more hardware support, the software
is already there to take advantage.

There is an incentive for the software houses to write multimedia
apps because they know it will work to varying degrees on any Mac
which can run QT.

If anybody thinks this is a bad idea, I will direct them to the
sad posts from the people who have trouble between AA and AGA.
I suspect having a single universal API, which will lay on all
hardware, and _KILLING_ any devloper who goes around it is
really a good idea.

That's rubbish. The 68000 is a much more efficient than a 286, and even
blows a 20MHz 386sx out of the water (at least in a PC architecture).
The x86 family requires more clock cycles for a given instruction than
the equivalent 680x0 instruction. Fact.

> (wich was the cutting edge then) became available and the PC
> quickly transfered to the new processor (the 68030 wasn't out
> until a year later).

The 386 was never cutting edge except in the PC world. Have you ever used
a sun386i ? They ditched the intel chips quick smart when it became apparent
that they weren't going to get a good enough performance from the chips
even when used in a non-PC architecture. They moved onto motorola chips
(the Sun3 is a 68030 machine) before going into RISC.

The ARM1 was available at the same time as the 386, and to be honest, it
really is a much faster & more efficient CPU. Compare the original
Archimedes machine to a 386 at the time - there is no comparison.

Now compare a modern Acorn RiscPC to a Pentium PC - the PC still loses,
and the price point is the same.

So don't try to say PC's have ever been state of the art - they aren't,
they never have been, and people will laugh at you for saying it.

> Um, you could also run the Amiga with one drive in those days.

I tried them both when I got my atari. The amiga was beatiful hardware,
let down by an OS which was initially very unstable, and a prohibitive
price tag.

>: Kick 1.x is the worst visual impression among OSes available.
>
> Still much better than the Atari OS - _IF_ you ask me....

That statement requires an IMHO - and a straight jacket :)

(hmmm... but GM specfies only a few controllers such as PAN,volume ad
modulation... the phase,flange and reverb would be System Exclusive, so
the file would not work with ALL GM keyboards, please don't argue i've
got the GM specs in front of me, I used them to write a DSP Synth module
(published soon) for the Atari Falcon which turns the 56001 DSP into a
24 voice GM synth - your above statement of '32 polyphony' G MIDI is
rubbish, General midi specifies 16 dynamic voices + 8 percussion tracks,
any genereal midi song must stick to this if it is to meet the minimum
standard.
My Falcon app generates 24 voices of 16bit sound, which are mixed
internally with 24bit precision, each voice has stereo pan, volume,
and full ADSR wave (interpolated on each sample point i.e. each 48khz
voice has a 48khz ADSR wave which is applied at each point) - This
program is due to be published in a few months, a version will follow
for the Cubase Audio 8 channel digital outputs which are used professionally.

I think your out of your depth here, you may use the stuff, but I write
them - I apologise for my arrogance.

:> at least 95db dynamic range (note I did not say s/n ratio, but

Actually the 80286, 80386 and 68000 use the same number of cycles per
memory fetch. The 68000 beat the 286, at the same clock rate, because
of the instruction set, and instruction timing. A 12mHz 286 was comparable
to an 8mHz 68000 in terms of getting a job done.

The 80386 is the equivalent of a 68030 running on an async 32 bit bus with
one wait state. With the additional instructions available, and improved
instruction timing, the 80386 is an equivalent processor, at a given clock
rate.

Brian

Dunno, seems so. Haven't used this version, but _cool_ programm ! Great
sounds possible, but not in real time. A little bit to complicated for me,
but if you have little experiences with C and other languages, you will get
a lot out of it. I just changed the samples and the notes, clicking around,
changing some numbers. Hope that they don't remove the older version !!! H.

Erm - Sun started out on 680x0, and turned to RISC when Motorola couldn't
keep delivering high performance 68K series processors at a rate
competitive with RISC processors. Somewhere in there they did the 386i
experiment. Your post seems to imply that they switched to 680x0 from
x86, and finally went RISC, which was not what actually happened.

As much of a Mac advocate as I am, I don't think this is true.

I can find no reference to this in any of the "Inside Macintosh"
books.

As far as I can tell, Mac sound is either sampled at various rates,
or tones of a specific frequency. I can't find anything in the
hardware or software which allows one tone to modulate another.

I suppose it could be emulated with a fair bit of overhead.

Oh well......

>x86, and finally went RISC, which was not what actually happened.

I do stand corrected on this point (someone mailled me the real order of events). What confused me was that the Sun3 remained in production for quite a while after the 386i bit the dust ('coz it was better & faster & more reliable), so we got a few Sun3's at work after 386i's stopped being produced (so I wrongly assumed they were the more recent machine).

Thats even worse though - Sun use a 68030, start makeing a 386 based machine, then stop making the 386 machine again, but carry on with the 68030 machine (I've been told they made Sun3's & Sparc's at the same timefor a while).

Appologies for my initial (wrong) post. I stand by what I said about Intel & PC architecture though - it sucks real bad.

Craig.

>playback MIDI data, interpret, AND synthesize sound. This is not as ideal as
>having a dedicated MIDI synthesizer purring under the hood. With the Mac QT
>or Note Synthesizer approach, you

You miss the point. Those people who need better than the default
QT voices can buy a Midi card or plug in a synth!!!!

The QT stuff is for the poor guy who doesn't have money to throw
around. It's there so that a multimedia guy can use Midi to do
his soundtrack for his game. This can allow much smaller binaries
and he can count on all Macs being able to play the sound!

People seem to have it in their heads that just because Apple was
nice and licensed those samples from Roland and put them in QT
that that was the only way to do Midi on a Mac!!!!

You really can have it both ways!

Football, Labyrinth of Time, Legacy of Sorasil, Lemmings CD32,
Liberation, Lunar-C, Mean Arenas, Microcosm, Morph, Naughty Ones,
Nick Faldo's Championship Golf, Overkill, Pinball Fantasies,
Ryder Cup Golf, Seek and Destroy, Sensible Soccer International,
Seven Gates of Jambala, Sleepwalker, Striker, Summer Olympix,
SuperFrog, Super Methane Brothers, Surf Ninjas, Total Carnage, Trolls,
UFO: Enemy Unknown, Ultimate Body Blows, Whales Voyage, Zool I&II

CDS THAT DO NOT WORK!
Alfred Chicken, Brian The Lion, Cannon Fodder, Chuck Rock I+II,
Dennis, Impossible Mission 2049, James Pond 3, Lost Vikings,
Manchester United, Nigel Mansell's World Championship,
Pirates! Gold, Project X, Sabre Team, Sensible Soccer,
Simon The Sorcerer

Anything else you want to be listed? Just suggest it to me,
but if I like it, then _be prepared_ to give me a healthy
collection of names for it.

Help needed with Atari ST/Falcon software. Many of titles
above exist for it too, but I have no information which
include modem/cable options on ST versions too. Therefore,
I shall not mention ST on them, unless I have clear
verification from an ST user.

Want to help me with the lists? I could use someone
with co-author, collecting software titles for those lists
with me, so the updates would be more complete and
happen more often. Co-author MUST have E-Mail.

All lists are updated more or less regularly, depending how often
I come across new list-worthy items myself, or anyone cares to
report them to me. I can be contacted at several sources:

!! E-Mail: jkauppin@muikku.jmp.fi or grendel@freenet.hut.fi !!

IRC: "Grendel-B" (#Amiga, #C-64)
FINNS ONLY: BBS Neuvosto-Savo 977-1525280 (2400-14400)
1 (2400)

2 (2400)
FINNS ONLY: MikroBITTI BBS "MBnet" as "Jukka Kauppinen"
FINSS ONLY: huomatkaa, ei en�� Fido-osoitteita. K�yn Fidossa
en�� vain pudottamassa t�m�n listan, postin luku on j��nyt
sikseen.

Internetters : PLEASE USE E-MAIL! I MOST PROBABLY
WON'T SEE YOUR POSTINGS FROM NEWSGROUPS!

Please be active and report any mistakes and additions. I can't
personally find everything, but would like very much help the
computer community and games freaks with as complete list as
possible.

This list is freely distributable, and I encourage everyone to
do so - but please also mention the Version-number. Suggested
filename : GGLxx.* (LZH or TXT, please). xx for version number,
like GGL21.TXT. Thanks!

(ps. Latest revisions of Air Warrior support disks available from
Neuvosto-Savo and MBnet directly from author. On Amiga/PC formats.)

Apple Brings Music to the Macintosh with Help from Roland Corporation

CUPERTINO, California--May 10, 1994--Apple Computer, Inc., a computer
and information industry pioneer, and Roland Corporation, a leading
manufacturer of professional musical instruments, today announced an
agreement in which Apple will license Roland's musical instrument
sound collection for use in future versions of QuickTime , Apple's
software that brings multimedia capabilities to computers and
consumer electronics devices.
The Roland Sound Canvas musical instrument collection includes
digitized samples of more than 10 instrument families including
piano, organ, guitar, bass, strings and orchestra, ensemble, brass,
reed, percussion, sound effects and more. These sounds can be used
to create and play music on computers--without users needing to know
the technical nuances of MIDI technology.
"Until now, our instrument samples have been used primarily by
professional musicians," commented Ikutaro Kakehashi, president of
Roland Corporation. "The rapid growth in the multimedia industry,

however, has prompted us to lower the barriers to entry for people who want to create and play music, without assembling an entire music studio. Apple's move to include our Sound Canvas libraries with QuickTime will make high-quality music much more widely available, while allowing a natural upgrade path to Roland's professional instruments."

"Like music in feature films, music in CD-ROM titles and multimedia presentations results in a more approachable, entertaining user experience," said Tom Ryan, manager of the AppleSoft Media Software Group. "Over time, music will become a standard part of the Macintosh experience."

QuickTime Music Architecture Makes Music Easy

The QuickTime Music Architecture, a component of QuickTime 2.0, includes several features that make it easier for computer users to create, edit, play, and synchronize music with video. Through the use of the Roland instrument library and Apple's proprietary sound synthesis technology, the architecture requires no additional hardware to play music.

A key feature of the QuickTime Music Architecture is that it requires very little of the user's disk space. For example, Beethoven's Moonlight Sonata would require nearly 180MB if recorded as CD-quality audio, but when stored as a QuickTime movie it only uses 75K of disk space. Or an entire corporate presentation--complete with high-quality images with background music--could fit on one floppy disk.

The QuickTime Music Architecture is also compatible with MIDI, yet is distinctly different from MIDI. Any Standard MIDI File can be converted directly into a QuickTime music movie, and MIDI devices, such as MIDI keyboards, can record directly into music movies. In addition, the architecture is scalable, so it will automatically take advantage of the best available device for playback--including MIDI devices, such as those offered by Roland. Unlike MIDI, additional hardware is not required and users do not need to know how to configure instruments or channels, or understand complicated file formats.

QuickTime 2.0: Bigger, Faster Video

QuickTime 2.0, announced this February, not only includes enhanced support for music, but also provides greatly increased performance for video. The latest version of QuickTime provides for larger video windows to be played at faster frame rates, resulting in full-screen movies without the addition of hardware. QuickTime 2.0 also provides an infrastructure for development and delivery of interactive television applications, including MPEG support and network enhancements so that QuickTime can address distributed networks and devices.

System Requirements

QuickTime 2.0 will run on any color-capable (68020 or later) Macintosh computer running System 7 or 6.0.7 with at least 2 MB of memory.

Availability

The QuickTime 2.0 developer kit for the Macintosh is expected to be

available in mid-1994. As with previous versions, QuickTime 2.0 is designed to permit cross-platform compatibility between platforms which support it.
Headquartered in Cupertino, California, Apple Computer, Inc. (NASDAQ:AAPL) develops, manufactures and markets personal computer, server, and personal interactive electronic systems for use in business, education, the home, science, engineering and government. A recognized pioneer and innovator in the information industry, Apple does business in more than 120 countries.
Roland Corporation is a leader in the development and production of electronic musical instruments. Headquartered in Osaka, Japan, Roland manufactures and distributes products through four divisions: musical instruments, contemporary keyboards, professional audio and a newly formed multimedia division. Roland promotes a multi-brand strategy which includes the Roland, BOSS and Rodgers lines of products. Roland is a global company with 19 overseas joint ventures and affiliates, 40 distributors, and six R&D facilities worldwide.
-30-
Apple, the Apple logo, and Macintosh are registered trademarks and QuickTime is a trademark of Apple Computer, Inc. Roland is a registered trademark and Sound Canvas is a trademark of Roland Corporation.

Message-ID: <3fnc1f$fm@ccshst05.cs.uoguelph.ca>
Source record: 13981

: And what makes you think it's alive..

- It's in stores,
- It's selling
- There are new games
- There are third party developers making games
- It's talked about highly in magazines
- There are commercials on tv
- I know people who bought them

: That prediction was made before the Sega cash infusion. I wonder what the
: condition of the company would have been today without the cash infusion.

Have you learned nothing? The Tramiels always find a way to
survive. They may not please everyone, but they know how to keep a
company afloat.

: The Tramiels have screwed what ever products fall in their hands..

You know about the Tramiel's sex lives? Considering Atari's size,
the Jag is being well handled. What would you do? Huh?

: The 3do is doing better than the Jag. But only time well tell. I think the
: U64 and the Saturn due to thier distribution network will garner the lion share
: of the market.

Not by much. The 3DO is more of a flop because *MUCH* higher
sales were expected and it's bombed worse than the Jag. As for the
Saturn, Sega has divided the market with the 32X. And the Ultra 64 is
being released even though the SNES is not that old. Nintendo already
screwed millions of NES fans.

: Need we say more..

Please do! The ST sold well in Europe, the 7800 sold more than
two million machines on $300,000 advertising, the 2600 was a hit, the
portfolio was fairly successful.

There must be some secret I don't know about then, because even with
my midi keyboard hooked up, I could not get QT to drive it. In the
PatchBay window, the QT icon has only an input connector, not an output.
I *have* been able to use the keyboard to play QT instruments, however...

: >

: As much of a Mac advocate as I am, I don't think this is true.

: I can find no reference to this in any of the "Inside Macintosh"
: books.

: As far as I can tell, Mac sound is either sampled at various rates,
: or tones of a specific frequency. I can't find anything in the
: hardware or software which allows one tone to modulate another.

: I suppose it could be emulated with a fair bit of overhead.

Yes it probably could. Using one channel as the carrier and
another as the modulator could create a FM-like synthesis -
though it probably would create an undesirable effect on the CPU....

Cheers...

: > 16MHz) - right up to the point in 1987 when the 80386

: That's rubbish. The 68000 is a much more efficient than a 286, and even
: blows a 20MHz 386sx out of the water (at least in a PC architecture).
: The x86 family requires more clock cycles for a given instruction than
: the equivalent 680x0 instruction. Fact.

Eh, care to elaborate this a little...?
I'm wasn't comparing PC-architecture here - if you have
access to SpecInt-89 or -92 you will see that the 80386
and 68030 are in the same performance region...

: > (wich was the cutting edge then) became available and the PC
: > quickly transfered to the new processor (the 68030 wasn't out
: > until a year later).

: The ARM1 was available at the same time as the 386, and to be honest, it
: really is a much faster & more efficient CPU. Compare the original
: Archimedes machine to a 386 at the time - there is no comparison.

Of course it compares - the ARM might be faster but it was also
faster the contemporary 68030's....

: Now compare a modern Acorn RiscPC to a Pentium PC - the PC still loses,
: and the price point is the same.

You better give me some figures and a referance here....

: So don't try to say PC's have ever been state of the art - they aren't,
: they never have been, and people will laugh at you for saying it.

Now then, I *NEVER* said that the PC was state of the art (grin)
but that the 386 was when it came out - speedwise.....

: > Um, you could also run the Amiga with one drive in those days.

: I tried them both when I got my atari. The amiga was beatiful hardware,
: let down by an OS which was initially very unstable, and a prohibitive
: price tag.

It seemed extreemly unstable to many who used one because they
mostly used pirated software. If you cared to invest in a program

wich wasn't copied, it was as firm as my mothers chest.....

: >: Kick 1.x is the worst visual impression among OSes available.
: >
: > Still much better than the Atari OS - _IF_ you ask me....

: That statement requires an IMHO - and a straight jacket :)

OK then........everyone is entitled to his/hers opinion.... 8)

Cheers...

: , so
: the file would not work with ALL GM keyboards, please don't argue i've
: got the GM specs in front of me,

Argue GM? Please don't put words in my mouth?

: I used them to write a DSP Synth module
: (published soon) for the Atari Falcon which turns the 56001 DSP into a
: 24 voice GM synth - your above statement of '32 polyphony' G MIDI is
: rubbish, General midi specifies 16 dynamic voices + 8 percussion tracks,
: any genereal midi song must stick to this if it is to meet the minimum
: standard.

What on earth does the number of MIDI-channels have to do with
the polyphony of a sound-device - I'm sure you heave heard of
Running Status? (otherwise I'll give you an indepth explenation
if you should request it)
The point with GM was to standarize the sound-patches within a
MIDI/sound-source enviroment (127 predetermined patches although
Roland took this a little further with General Synthesizer functions
wich is a superset of thoose specified by GM).
And yes, this was part of my point - the Roland cards are able
to interpret my song (ever heard of MPC-401 (LAPC-1/MT-32) and RGS?).
So then, should the _standard_ Mac (or our Falcon) be able to do as
braged by a good number of our Mac friends here......

: My Falcon app generates 24 voices of 16bit sound, which are mixed
: internally with 24bit precision, each voice has stereo pan, volume,
: and full ADSR wave (interpolated on each sample point i.e. each 48khz
: voice has a 48khz ADSR wave which is applied at each point)

Is this Extended Multitimbral? What are the s/n and s/r
ratios? What kind of effects are appliable? Is there any

kind of oversampling involved? (how do you overcome 'Phase
Shifting' when looping?)
What type of interpolation algorithm/s is/are used, linear?
If so what formula? (ex. if the address pointer indicates an
address of (n+k) where n is the integer part - I presume you are
using this with the MC56001 - and k is the fractional part).
How about digital filters? Any layering? Antialising? Splits? etc..etc.

: - This
: program is due to be published in a few months, a version will follow
: for the Cubase Audio 8 channel digital outputs which are used professionally.

Ok, I'm looking foreward to this - please give me a call when
this is ready...(yes, we have a Falcon in our studio aswell -
we run Cubase on it occasionally (a shame it's not available for
the Amiga but BPPro does a good job)).

: I think your out of your depth here, you may use the stuff, but I write
: them - I apologise for my arrogance.

You're welcome but I think you have mised a point or two along
the way - did you follow this subject from the beginning?

: I speak the truth, your basically now making up some excuse that it isn't
: wavetable unless the SNR isn't more than 89db? Please don't make me laugh.

Hmmmm......
Once again :
I have *never ever* said that the Mac (or ANY other computer) -
by definition - doesn't use some type of wavetable (digital
sample-based synthesis) to reproduce sound - infact most
recent computer-brands (the C-64 didn't).
My point was that theese standard Mac's don't do what a non-tech-
musical-anti-guru-play-the-piano-and-compose-a-beautiful-piece
would assume to be Wavetable.
If used in a professional manner, any sound produced or otherwise
processed through a sound-system creates electromagneticly indused
noise in the cirquitry - of course. In order for - lets say - a
network TV-channel to accept the produced product, it has to meet
a sertain quality criteria - both for audio and visually.
Usually this implies not going below a s/n ratio of 89db in a
digital record and broadcasting system (or a classical recording).
The dynamic range is just as important althoug the use of 'Limiters'
are widespread to boost the d/r to acceptable levels wich *usually*
implies a d/r of about 95db (wich has an undesirable effect on s/n
ratio).
Both theese suffer under *some* "slow" DSP routines as it probably
would be within a PMac wich supports 8 (stereo) voices with a s/n
ratio of 85db (I presume).
When you try to mix 32 16-bit 44.1KHz voices (multitimbral of course)
with multiple effects etc. the CPU just can't produce a sound quality
wich meets theese requirements - not by a longshoot.

It might, however, be quite capable of producing 32 voices
simultainously - even a 25MHz '040 is able to do this with
acceptable sound quality as defined by the average man on the street.
(my Paula in my Amiga is able to do 4 voices in 8-bit at 28.3KHz each
wich with the 6-bit volume control effectivly makes it 14-bit
(85bd d/r produced) although the s/n ratio is about 48db))

Now, for God's sake, I hope I don't have to write this again, and
again, and again - I only have x years to live....

Cheers...

188. Sinclap's brain found??

Newsgroup: comp.sys.atari.advocacy
Date: 1995-01-20 21:00:50 UTC
From: eddiea@bnr.ca
Message-ID: <3fp8a3$l@crchha60.bnr.ca>

I was reading the AMW the other day and came upon this article. Are they talking about our buddy Peter Sinclair a.k.a. Sinclap?? You Decide.

This article has been reproduced in its entirety without permission of Astounding Medical Weekly newsletter (vol. 8 issue 10, pg 12):

==========

PETER'S BRAIN FOUND!!!!!

The Banzai Institute has done it again! On Jan 12th 1995, Doctor Buckaroo Banzai, with the assistance of several Institute members succeeded in finding what everyone said did not exist: Peter's brain.

Dr Banzai released the following statement:

Through the years, there have been several reports of MWOB's (Men WithOut Brains). They were all fairly easy to solve- Genetic Mental Deficiency Disorder, Heinikens Multi-Brain-Cell Shrinkage Syndrome, Saget's Brain Stem Detachment Complex. All these were discovered and identified by this Institute's previous attempts to prove/disprove that MWOB's do in fact exist.

We had heard about Peter, and the multitudinous assertations that here indeed was a MWOB did not fail to catch our attention. We contacted him early last year and invited him to the Institute to take some tests. The initial series of tests and scans looked promising, so we set up a schedule for Peter to return and take more tests. All the data was indicating that Peter was a MWOB. Then two weeks ago, New Jersey and Dr. Hakita detected a very faint neural retransmission firing in Peter's cranial area. We informed Peter of this and he was very eager to allow us to operate. At this point he had become very concerned that he might actually be a MWOB. Notoriety aside, who among us would really want to go down in history as the first Man Without a Brain? We removed the top of his cranium on January 12th. We thought we had prepared ourselves, but it was still a shock to actually view the vast empty space we had uncovered. We had intended to use our new enhanced laser scanning tunneling lepton microscope to search for the brain, but with such a large volume of space to search, it would take weeks. We could not leave the top of Peter's head off for that amount of time. In a flash of inspiration, Perfect Tommy theorized that having known Peter for the past year, we could assume that if he has a brain, it would move extremely slowly, if at all, allowing us to do away with Heisenberg's Uncertainty Principle. We quickly calculated the exact location to search for the brain, and were able to capture a picture of it with our new microscope. Peter has recovered completely and is enthused at having a new syndrome named after him - Peter's Ultra Microscopic Brain Syndrome (PUMBS).

Dr Banzai further said that after spending such an exhausting year locating Peter's brain, the Institute would be putting further research into MWOB's on

hold, turning instead to MWNP's (Men With No Penises). Although there is no comment from the Institute, it is rumored that Peter is also involved in this study.

Huh? What *are* you talking about?

QTMI contains musical instruments components and wavetables (licensed from Roland, in fact, and stored in the form of snd resources) in order to support software-only playback of General MIDI files through the Mac speaker.

And the various sound chips in the Macs have done wavetable sound (based on digital samples) since time immemorial. Resampling, mixing, et al is typically done in S/W, but it's not FM based.

What's Macoroni? Some System 7.6? I haven't heard about any such
planned Apple OS release in c.s.m.adv or c.s.ppc.

I know about Apple's record earnings - I read about them in the NY
Times. They did well during the Xmas season because of the Pentium
FPU-bug fiasco.

I don't think Apple has to worry about Windows96...that won't be out until
the next century. ;-)

Carol (carol@alaska.net) wrote:

: Why does Power2 need 5 times the number of transisters to make
: a similar speed chip as an Alpha?

: Do not fall into the trap of thinking that a chip with a lower
: clock is better than a similar performance chip at a higher
: clock. People think "Well, if Power2 at 72Mhz is about as fast
: as an Alpha at 275Mhz, then think of how fast Power2 will be
: at 275Mhz". Won't happen.

: Some chips are designed to be as simple as possible, but can
: run at a very, very high clock. They are fast.

: Other chips are deigned to be complex and do a lot in each clock,
: they are limited to a low clock. They are also fast.

: Each company has made a bet about which is better in the end.
: Either simple, high clocks, or complex, low clocks.

I argree.
I would also like to rise a "little something", hopefully to form
the bases of a discussion - suitable for an afterthought perhaps..
1
During the past dozen years or so, many a time have the
computer-scientists found themselves in serious boubt of the
likelyhood of further quantum performance progress and and quietly
moaned: "We've finally hit the wall, we can't make it much
faster now - nomatter what". This has been the trend every couple
of years since the days of the 68000 design.
CPU-performance is a sum of several fatcors : in order of
importance ; feature size, data-bus width and silicon purity
or die size if you will.
The limit of data-bus width was apparently hit several years
ago within the mainframe community. In the next couple of years
CPU performance will be defined mostly by feature size and silicon
purity alone - and this "wall" is fast leaping towards us.
We are fast reaching the absoulute density wich silicon atoms
are able to operate before quantum effects takes over and makes
it impossible to predict the behaviour of the electrical path
within current Sa cirquit-technologies (CMOS, BiCMOS etc.).
Yet, the biggest problem today isn't that we are not able to
produce even tighter Sa masks, but the enormous expense related
to mass-production.

2
This is somewhat what happend with the much expectant GaAs-chips
(a combination of gallium and arsenic in a single crystal wich
should yield 6-8 times faster CPU's) - because of the big market
dominance of Sa it would've costed much more than first predicted
to produce GaAs-chips in large quantities.
Complete new technology in development, producing and manufacturing
prooved to be faar to costly. Even so to the extent that Cray
Research - the absoulute forerunner for GaAs-technology together
with Gigabit Logic - had to put it's Cray 3 prodject on a
"wait-state" and concentrate on it's next generation of silicon
supercomputer - the C90.
3
If we, however, concentrate on Sa-technology - where do we stand?
The latest superscalar processors have all you probably
could imagine of clever subtlety : a large on-chip, nonblocking,
branch prediction, branch folding, critical-word-first, out-of-
order execution, speculative prefetch, register renaming, write-
back-caches, operand forwarding, buffered writes and multiple
execution units.....seemingly everything.
4
So the other big problem facing the Sa-chips is clock-speed.
Sa-chips will, however simple and pure the architecture might be,
not be able to work proparly much above 500MHz - an absolute physical
limit for Sa wich is governed by the fact that Sa-chips are not able
to work at tempratures much higher than 150 degrees Celcius.
This leads me to belive that the Power2 technology might have a
firmer grip on reality for future development than that of the Alpha.
Of course I could be wrong - as history has shown in previous battles.
5
Several developers of high end CPU's are concentrating great effort
on producing a GaAs-chip with effectivly would be a simple chip
upgrade - the goal is to offer a pin compatible upgrade to existing
state-of-the-art processors, much like you upgrade a '486 to a
Pentium - with the drawbacks this approach implies though. It is,
however, a much more convinient and smooth way to - lets say -
quadruple (maybe even more) the speed of your CPU wich again ensures
a big market-share right from the beginning...
6
What about other technologies. In light of the recent CICS/RISC
"struggle", it could be appropriate to mention that some time back
a survey was made on a fundamental new approach to CPU behaviour
(I'm sad to say I don't remeber by whom).
This is anther major problem in the fundamental subjective way
the CPU's of today operate - the parallelism in the instruction
flow itself. The author then went on to argue against using
instructions at all - something already, in principle, pioneered
by sertain gfx-cards to improve QuickDraw performance by executing
the QD commands directly in hardware - something wich of course would
require some sort of logic interpret system (if anyone have any info

regarding this subject, mail me will you. I've been trying to dig
uo this info ever since with less degree of success. I *think*
I read it somewhere in a science-magazine about 15 months ago.)
7
What about the even more state-of-the-art synthezsized diamond-
layer based thechnology in development (possibly by Inmos
labratories) wich should produce chips at least 20 times faster
than todays best silicon dies.... Anyone have relevant info on
this too.
How about _very_ recent advances in BiCMOS, bi-polar or MOSFET
research - I'd be most grateful for any contribution....
8
I don't think draging infant research like optical, bio/organic,
super conductive or massive parallel neuro-network computers
into the discussion will bear much relevance in my (next) 5-10 year
timeframe, although it could be a comforting and creative challenge
to "dream" a little.....
Last but no least, I have tried (as always) to keep this article
in a simple fashion - I wan't "everyone" who participate - if not
by more than reading - at least be able to understand what is said.

And, for the first time ever, my disklamer debut. Completly home-made
by a good friend of mine wich also is the father and inspiration-
source (and somewhat co author) of this article - Bjornar Bolsoy.
After several houres of wishful thinking (and a barrel of beer),
I found that an article was perhaps not that of a bad idea..

"Freedom and democracy? Great! - as long as you follow the rules."
-- Bjornar Bolsoy --
Cheers...

Well, the areas you mention are indeed the ones that offer the
greatest long-term relief. You left out quantum-effect devices and
simple massive parallelism, both of which may happen in the shorter
run.

>-Peter

How much was it before? If Atari's stock went from $1 to $3, that is a sign of good sales.

BTW what do you think Apple's stock will be after Windoze99 is released? Probably a lot lower than it is now, especially if Copland2007 suffers further delays - and I don't think that this Macaroni (what a code name!) stop-gap will cut the mustard. I bet Macaroni will just be a System 7.5 with a couple minor new features and about 10 more Toolbox calls rewritten in native PPC code.

Hi Terry, Lasse, Carol and All,

I've got a little to add, and some minor corrections....

In <tsikesD2rK4F.H92@netcom.com>, tsikes@netcom.com (Terry Sikes) writes:
>In article <3fqfni$hnc@marton.hsr.no>, Lasse Olsen <lolsen@hsr.no> wrote:

I'm not sure what you mean by "Sa" - Si?

Silicon still has a bright future ahead of it. A big problem with making silicon integrated circuits faster is the capacitance between the circuit elements and the silicon wafer substrate. There are techniques to reduce this capacitance by putting a layer of silicon dioxide below the circuit elements. (e.g. SIMOX, BESOI, etc.) There are problems with these techniques, but progress is being made.

Another way of producing faster "silicon" integrated circuits is by using silicon-germanium alloys for the circuit elements. IBM has done a lot of work with this. Individual transistors made from this material have been shown to be very fast - approaching the speed of gallium arsenide transistors. But there are problems with SiGe as well.

Si, SiGe, GaAs, InP, GaN, Diamond, SiC, etc. all work best in different niches....

>> Yet, the biggest problem today isn't that we are not able to
>> produce even tighter Sa masks, but the enormous expense related
>> to mass-production.

I'm not sure I agree. Sure it is expensive to build a new fabrication facility for Si circuits on 8" wafers with < 0.5 micron feature sizes. But once the fab is running, producing circuits on that scale is *very* profitable. Industry is working on ways to produce these facilities so

that the cost isn't as large as once feared, and cooperative agreements between companies on the development of new technology is helping to reduce costs further.

>> 2
>> This is somewhat what happend with the much expectant GaAs-chips
>> (a combination of gallium and arsenic in a single crystal wich
>> should yield 6-8 times faster CPU's)

It's not that simple. A comparison of the Electron Mobility between GaAs and Si gives the 6-8 times figure. But the mobility advantage of GaAs only applies at regions in transistors where the electrons are under the influence of low electric fields. This is of course important, but doesn't tell the whole story. At high electric fields, electrons in Si and GaAs move at comparable speeds. One of the biggest advantage GaAs has over Si is that a practical "semi-insulating" substrate exists for reasonable costs. This greatly reduces the capacitive coupling to the substrate (discussed above) and makes fast circuits possible.

This is a complicated subject and has been argued about for years. An old joke in the IC industry is, "GaAs is the material of the future - always has and always will be!" :-)

>> - because of the big market
>> dominance of Sa it would've costed much more than first predicted
>> to produce GaAs-chips in large quantities.

Actually GaAs chips are much *cheaper* than they would have been if the GaAs IC industry hadn't been able to take advantage of the processing equipment, device computer models, etc., developed for the Si IC industry. There are many reasons why GaAs ICs are expensive:

1. Ga and As are more expensive than Si.
2. Production of GaAs crystals is more expensive than Si crystals.
3. GaAs is more fragile than Si, so wafers have to be thicker - meaning fewer wafers per crystal.
4. GaAs is softer than Si, so the wafers are more difficult to polish.
5. GaAs is toxic, so there are some safety issues involved in working with it.
6. Si wafers will be available in 12" diameters in a few years, while GaAs wafers are just starting to reach 6" diameters. Since the incremental processing cost for a 12" wafer is just a little more than a 6" wafer, it's obvious that devices made from a 12" wafer will be *much* cheaper than those from a 6" wafer.

You get the idea....

>> Complete new technology in development, producing and manufacturing
>> prooved to be faar to costly. Even so to the extent that Cray
>> Research - the absoulute forerunner for GaAs-technology together
>> with Gigabit Logic - had to put it's Cray 3 prodject on a

>> supercomputer - the C90.

The Cray 3 was/(is?) built by Cray Computer Corp. which was spun off from Cray Research. Part of GigaBit ended up with Cray Computer Corp, and part of it merged with a couple of other GaAs IC companies and ended up combined with TriQuint. GigaBit was one of *many* of the early players in GaAs ICs. As I recall, a Cray 3 was sold to one of the US National Labs. but wasn't delivered on time, so that Lab rejected it. Corrections on my recollection are welcomed....

[...]

So? There are often ways around limitations like this if you're creative and pound on the problem long enough. I recall that 10 years or more ago someone published a paper in which they had a Si circuit running at (I believe) 500 C. How? Well, they machined a fine array of ridges in the back of the Si wafer and used a liquid cooling technique to suck the heat away from the circuit. Crays and many mainframes have used liquid cooling for years. Yes, heat dissipation is a big problem, but it can be solved.

I recall that about 10 years ago the conventional wisdom was that optical lithography couldn't go below 1 micron feature sizes, that silicon transistors couldn't work above 1 GHz, and that you couldn't get light from silicon. All of these hard-and-fast rules from conventional wisdom have proved to be wrong, or at least not as simple as once thought. If the market demands microprocessors which run at 1 GHz, then someone will find a way to provide them. As an aside, I believe an article in the IEEE Spectrum magazine on the Alpha AXP microprocessor mentioned that the architecture was designed to eventually use 1 GHz clocks....

>> This leads me to belive that the Power2 technology might have a
>> firmer grip on reality for future development than that of the Alpha.
>> Of course I could be wrong - as history has shown in previous battles.

I agree that Power2 is neat. But, very few things are as easy to predict as one might hope! :-)

>> 5

That's a very tough market. I wish them luck.

[...]

>> 7
>> What about the even more state-of-the-art synthezsized diamond-
>> layer based thechnology in development (possibly by Inmos
>> labratories) wich should produce chips at least 20 times faster

>> this too.

Diamond is still a very immature technology. Diamond has lots of nice properties, but too little is known about how to make circuits with it to make it a viable market except where *nothing* else will work for the near future - IMHO. SiC has similar problems. Recently a lot of progress has been made in GaN technology and it has a lot of promise. But you won't see GaN microprocessors any time soon!

It'll take a *lot* of work, time, and money for anything to replace Si in the CPU market - and even then it may never happen.

>> How about _very_ recent advances in BiCMOS, bi-polar or MOSFET
>> research - I'd be most grateful for any contribution....

Check out the IEEE journals like Transactions on Electron Devices and the Journal of Solid-State Circuits.

[...]

Just my humble opinions....

Cheers,
Scott.

Nice article. SCIENTIFIC AMERICAN February 1995 Volume 272 Number 2 Pages 90-95

also contains an interesting article "Trends In Semiconductor Manufacturing"
which readers may find interesting. Talks about the limits of
photo-lithography, war between photo-lithography and x-ray lithography,
limits of these techniques, etc. Very interesting - check it out -
available on America Online too.

Jaideep

Peter,

: Not all stores, you know the important ones. The new U64 and the Saturn will
: be sold in their existing distribution which means a two minute drive to
: Wal-Mart.

If it was as dead as you claim, it wouldn't be in *ANY* stores.
As for the Ultra 64, don't believe everything. While I'll admit that
Nintendo is well supported by retailers, not all are happy. Radio Shack
in Canada is going to drop the SNES because they aren't making any money
off of them.

: No doubt it's selling some units..

If it were "dead", it wouldn't sell any.

: I would hope so, but games do not automaticaly make it a success..

If it were "dead", Atari themselves wouldn't be making games for
it.

: > - There are third party developers making games

: As well as the other consoles..

Do you think Jaleco, Tradewest, Readysoft, UBI Soft, Activision,
ID and others would even look at the Jag if they didn't think it had
potential.

: > - It's talked about highly in magazines

: Not all.

Most. Even "The Edge" and "EGM" have been favorable as of late.

: > - There are commercials on tv

: Barely.

Depends on where you live. I've seen more Jag commercials that
3DO commercials.

: > - I know people who bought them

: I know alot who have not..

Whoopie! I know a lot of people who didn't buy Super Nintendo's
or Genesis's. That point is stupid.

: The Tramiels could keep the company afloat with just 5 employese. What about
: the long haul that has revelancy.

Let's see ... losses have shrunken, Atari is growing and there is
renewed faith in Atari amongst 3rd party developers. I'd say the long
haul is pretty good.

: What I would have done was to coordinate a lasting partnership with developers
: and the distributors/retailers.

Excuse me? What do you call the partnership with Toys R' Us? What
do you call Atari's improved developer support program? What do you call
the joint advertising Atari has been doing with dealers? What about the
Jag Kioks? The Jaguar signs? The relaxed liscencing policy? Your point is
stupid, because Atari beat you to it.

What the Tramiels did was to dump product than
: on the retailers, skimp on marketing, R&D and than pull the plug on the product
: knowing that they could not or were not willing to do so..

Apple did the same thing with the Apple III, the IIGS and the
Lisa. Atari has since improved their relationships with dealers,
and increased marketing a *LOT*. Atari, like Apple or any other company
is in the business to make money.

: There are more releses on the SNES, so how are SNES fans being screwed?

Not yet. On the other hand, consider this: When the SNES was
released, Nintendo suffered a terrible Christmas and lowered the price of
the SNES so it was nearly the same price as the NES. This *KILLED* the
NES and caused 30 million people to be stuck with an orphan machine.
Unlike Sega, who offers upgrades (32X, Powerbase converter, etc.),
Nintendo drops machines quite quickly. Yes ... there are currently a lot
of SNES releases, but look at how the software support for the NES
collapsed when the SNES was released. Now, Nintendo is jumping ship again.

: First, the 2600 was not a Tramiel doing. Second, if the 7800 was a sucess were
: are the games? As for the Portfolio, were is the Portfolio II?

The 7800 software was impeded by Nintendo's illegal "software
controls." Many developers wanted to write for it, but were locked out
because of their contracts with Nintendo. Given the fact that the 7800
sold more units than the 3DO or Jaguar or 32X have, the developers should
have jumped aboard. The Portfolio development was suspended when Atari
rehauled it's operation.

> in native PPC code.

Marconi (note correct spelling) is supposed to be an interim release of the MacOS, between 7.5 and Copland. Reason being that they need an OS for their upcoming 604 PowerMacs with PCI expansion buses, and there are no plans to offer support for the new architecture PowerMacs in 7.5. It is supposed to be a PowerPC-only release, and probably will feature a lot more native code than 7.5.

Basically, Copland without the complete feature set, released along with the 604 PowerMacs so that they have an OS to run.

There are indications that Apple may initially release Copland for the PowerMac only as well. Evidently there is a faction that wants to release it as quick as possible for the PowerMac by deferring the release of the 68K version.

Sorry but I missed the start of this thread... are we talking about playing back stored waveforms (which I would call PCM), ditto plus some post-treatment like what the Roland U-110 and its relatives do (forget what Roland call this), or having a number of stored single-cycle waveforms and cross-fading from one to another so that each sound is defined as a locus in waveform-space? The last one is my description of what the PPG Wave and Waldorf [Micro]Wave do, although they call cross-fading by another name ... and that's what I would call wavetable synthesis.

BTW if anyone has a Waldorf Wave they don't want, I'll take it :}.
(You know that one day you'll have to choose between Her and the Wave).

> up and utilized when needed).

The Mac has a "sample-based synthesis system." It does looping, pitch shifting, interpolation, and some filtering either manually (under programmer control) or automatically through QT2's MIDI support. It stores sounds as series of samples to be played back. It stores instrument definitions as series of samples to be played back. Can you elucidate a bit further on what "a musical standarisation of Wavetable sound" is that the Mac does not do? To be blunt, it sounds like big-worded gibberish.

From:jchung@CAM.ORG (Jonathan Chung)
Subject:Atari user seeks Internet Provider in Innsbruck, Austria

I am looking for a Internet Service provider in Innsbruck, Austria (or closeby) on behalf of my brother who lives there (he is an Atari user). Additionally, I would like to know how much a shell, SLIP, or PPP account would cost, plus an idea of how much the phone company charges for time online.

Email reply appreciated. Thanx.

Jonathan

About 10 years ago Sir Clive sinclair deveoped a system of 'wafer-scale integration' whereby an ENTIRE computer could be mounted onto a circuit board, without any need for silicon chips. Indeed it got to the stage where Sir Clive built a Sinclair QL on a wafer, there was no sign of chips, resistors or transistors.

Um, no he didn't. AFAIK they never got further than having arrays of
DRAMs on a single wafer. The big problem, I believe, was the heat
generated by the things. The idea of having a wafer full of today's
power hungry devices (ourselves excluded, of course 8-) is a bit
erksome, to say the least...

According to "EE Times" of that time period, the difficulty of getting reliable,
consistent interconnects eventually killed the project. I believe they were
trying to put a system 370(390?) on a wafer.

> Lasse> reproducing sound) and MIDI (wich is a data protocol).

Apparently so. Given that you're still confused about sampled audio ("Wavetable synthesis" being a slightly inaccurate modern day buzzword for this on the PC Clones), I take it you consider this confusion a good thing :-).

Simply put, what they mean by "Wavetable Synthesis" in The PC Industry is audio synthesis by means of stored digital samples played through a D/A converter, rather than perhaps the various approaches to "sound chips", popular on machines like the C64 10 years ago and the PC Clone somewhat more recently. To add to the confusion, there really is a more accurate definition for "Wavetable Synthesis", but since that's not at all what is being done here, I won't go into it.

Sample playback is how the Amiga makes its sounds; it has four separate, DMA-driven 8-bit audio channels. Lots of the Macs do it this way, a few even have an AT&T DSP3210 with a real 16-bit D/A converter to do the job. Some of the add-ins for PClones work similarly, usually using a Motorola DSP56001 or perhaps one of the 16-bit AMD DSPs to manage the playback. The cool thing about using a DSP is that it can mix channels in the digital domain, rather than in the analog domain like the Amiga does. That means that channels are essentially a software phenomenon, based on how much work the DSP can get done in one audio sample frame.

> Lasse> In light of this it's apperant that neither the Mac's sound-system
> Lasse> nor any other standard computer platform use Wavetable to reproduce

>I am not sure what you mean by the "standard platform", but there are
>several PC sound cards that use wavetable synthesis. October '94 issue
>of Windows Magazine reviews 16 of them.

"Keyboard" had a review of some last fall, too. They're pretty common these days. Just because a card uses samples is no guarantee that a sound on one system will be as good, or as true to the intended MIDI code, as it might on another system. The whole point of General MIDI, rather than poking bits in an FM-synthesis chip, is that applications get to say "what" rather than "how", leaving the "how" as a problem

for the sound card itself. That's device independence at its best. Just like your PostScript output doesn't look as good on a HP-LJIII or in a GhostScript window on-screen as it would printed on clay paper by a professional 1200 DPI Linotype machine.

>I personally have the SB AWE32 card that uses wavetable synthesis. It
>has a built in 1MB ROM to store standard patches (General MIDI, MT-32,
>and GS (I think). It also allows for downloading custom patches.

There's the rub. First problem is generating the samples. Some companies will simply do this better than others. Then there's the matter of compression. The AWE32 puts all its standard samples in a 1MB ROM, using a lossy compression algorithm. Get a Turtle Beach or Roland card and you have maybe 6MB for the same sample set. And a better set of samples to being with, which you're paying for.

>off of them.

Not all maybe happy with Nintendo's policies but these retailers will not drop the product. Hell, there are retailers who are not happy with Compaq computers policies. But, Compaq is #1 worldwide. The Jag flopped. Yes, stores have some stock in low quantities. Retailers next fall will have to decide weather to keep the Jagflop in terms of sales and or make room for the upcomming new consoles.

>: No doubt it's selling some units..
>
> If it were "dead", it wouldn't sell any.

>collapsed when the SNES was released. Now, Nintendo is jumping ship again.

Did Sega offered an upgrade from their 8 bit console to the Genises? Eventualy
consoles / computers have to be replaced. Apple/IBM continues to invest in new
computer models to advance the market with new technologies. Eventually my
Performa 550 will be outdated soon, but my investment is safe due to a planned
inexpensive PowerPC upgrade that will replace my mother board.

Atari abandoned their computer line. Apple/IBM is committed with new models
and technology.

I think so. Atari has a license to use it in the ST

>
>Therefore the Atari infact has two operating systems running in
>parrallel TOS and GEM.
>
There is one operating system : TOS
But it has 2 parts: AES and GEMDOS
AES is the part that handles the application environment
(AES=Application Environment System)

GEMDOS is the part that handles the disk

You should consider AES as a shell with a graphical user interface
(like Microsoft-Windows on PC)

: Not all maybe happy with Nintendo's policies but these retailers will not drop
: the product. Hell, there are retailers who are not happy with Compaq computers
: policies. But, Compaq is #1 worldwide. The Jag flopped. Yes, stores have
: some stock in low quantities. Retailers next fall will have to decide weather
: to keep the Jagflop in terms of sales and or make room for the upcomming new
: consoles.

If the Jag wasn't selling, many stores such as EB would have
dropped it already. They haven't. Radio Shack is dropping the SNES
because they aren't making any money on it.

: Let me use flopped than. Flopped is the stage before death. One Software
: developer quoted 150,000 Jagflop sales worldwide.

Which software developer? I find that 150,000 quote *VERY* hard
to believe.

: Atari believes it is not dead, but the market will hammer it in their brains,
: or lack of. What else does Atari have? Trading cards?

If the Jag is dead, why are UBI Soft, Tradewest, Readysoft,
Beyond Games, Activision, US Gold, Telegames, Jaleco and others making
Jag games? Huh?

: Announcing and market entry are different. So were are the games?

Well, they *have* been started. I have seen the Jaguar versions of
games from UBI Soft, Tradewest, Readysoft, and Beyond Games. It's not as
if they're vapourware. Also ... Telegames has already released one game
with several more on the way.

: Yes, favorable does not mean increased sales..

Funny ... that's one of the things EGM and Edge said ... Jag
sales have increased nicely.

: I remember Atari announcing these programs with the Lynx, 7800 and the 65GS but
: pulled the rug underneath of their partners.

Sorry Peter, but you're full of hot air here. I know the Lynx,
and 7800 situation *VERY* well and Atari did not do the same things that
they did with the Jag.

: Don't compare Apple's to Atari's. Apple backs up their market with sufficient
: R&D, marketing and on time product introductions(except system 8). Apple
: makes money after their investments/support bears fruitation..

Really? Tell that to Apple III owners. And Lisa owners. They were
shafted nicely by Apple.

: Did Sega offered an upgrade from their 8 bit console to the Genises?

No, but they did offer the Powerbase converter which allowed SMS
owners to play their SMS games on the Genesis. Hence, they could sell
their SMS. Nintendo didn't even offer that.

: Atari abandoned their computer line. Apple/IBM is committed with new models
: and technology.

Again ... what about the Apple III and IIGS?

: Well I have a 7800(in the attic with the 2600)

Mine's still in use. With over forty-five games (not counting
2600 carts), I'm not putting it away soon.

Ladies, ladies, don't you think your taking this all a bit too far ? Anyone would think this guy, Mr. Original Bad Spelling ;), was doing something that personaly injured you.

The fact that the original post was just that (a post to a usenet group) & not a major press release from an international corporations' boss, should realy be weighed against the vigure of your responses.

OK, so bad spelling isn't something that should be ignored - especialy by the education authorities - but then again it isn't important enough to ridicule people about either.

I know many people that are to a certain extent dislexic, and I'd wager that they are every bit a well rounded person as ALL OF THOSE that threaded to this subject!!!

Christ, if I back tracked all these peoples' posts to the usenet I'm sure there are spelling mistakes even by these hallowed saints-of-spelling & grammar.

Simon.

BTW, if there are spelling mistakes in my post I don't f**king care - good spelling or not I'm sure you get the gist of that!!!!!!!!!!!!!!!!!!!!!!!!

No need to, I've done it already....
This whole "frenzy" really started out by me modestly pointing
out that the standard Mac really dosn't do what we in high end
music, comercial and broadcast-production would refere to as
"Wavetable" - the potential sound-quality is just not up to
theese standards (I've had 32/64 voice polyphony with effects ect.
in mind all the time)....
Although I've been constantly repeating this ever since, new people
have entered the discussion without reading the previous posts,
thereby effectivly misinterpretating many of the arguments - I really
don't have the time or resources to repeat every statement I do....
The fact that someone somewhere split the discussion into several loose
treads, of course added to my ever increasing workload - you wouldn't
belive the amount of work wich this (now rather irrelevant) issue
has consumed.........

Cheers...

I think it was called the Trinity, or Trilogy chip. Last I heard, they were
fabbing the chip, but there were problems getting it work. They claimed that
it was the most complex chip ever fabbed, probably helped by some
marketing folks. I think it finally folded in 1989, or 1990.

For the record, it wasn't the Amdahl Corporation but Trilogy Corporation that failed with WSI. Actually, they did produce some useful innovations and patents, but never got the CPU to run.

One major problem was hotspots. IBM is very close to the single-chip CPU idea with their Renoir and Monet programmes - these use four chips for a single System/390 processor.

These announcements were made way back than when optimism was high for the Jagflop. So far I have only seen less than 20 games listed. I suspect many will hold off with additional game announcements due to developing for U64, Saturn, Playstation and maybe the pippin.

Yes.. But Apple rebounded and is still in the computer business, unlike Atari.
These flops were in the early 80's. Company's learn from mistakes unlike
Atari.

You need to have the Music Configuration app (maybe it's a control panel
these days) - it allows you to see QT as a source in patchbay, and you can
take it from there. An old version (that doesn't work) was in the beta CD,
and the newest version will be available in the 2.0 developer CD (I don't
think it's out yet but should be soon) and is currently available in the
CD-ROM bundled with Hayden Books' new QuickTime book (QT: The Official
Guide for Mac users or somesuch is the title). FWIW, you also get every
little QT utility the QT team has written (single fork flattener,
rechunker, etc), the full version of VideoShop 2.0 ;), sample movies, and
demo versions of various other commercial QT tools.

I've used the Music Config with an external Roland box. It's *way* cool.
The "directly supported instrument" list expands considerably, for
example.

I guess I should modestly point out that the "standard" PC probably won't either.

To do "professional" stuff, you would connect a MIDI keyboard/synth to your Mac/PC, yes?

235. Re: Bye, bye Atari!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-01-26 18:14:57 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3g8or1$fl9@ccshst05.cs.uoguelph.ca>
Source record: 13936

: A chain of stores has already. This was posted in r.g.v.a..

Whoopie. A chain of stores just dropped the SNES too. It happens
a lot.

: He hangs out in r.g.v.a. I believe he develops for the Jag.

1) You're not sure if he's a developer.
2) He's could be lying to you.
3) Find me a quote of a *real* honest to goodness developer and
I'll believe you.

: These announcements were made way back than when optimism was high for the
: Jagflop. So far I have only seen less than 20 games listed. I suspect many
: will hold off with additional game announcements due to developing for U64,
: Saturn, Playstation and maybe the pippin.

I've heard some things to the contrary ... namely from
Activision. The president admitted that they were initially dragging
their feet on Jag software, but now things are going full speed ahead. US
Gold is about to manufacture Cannon Fodder and Syndicate.

: From a hundred to a couple of hundred a day. Big deal..

Proof Peter?

: I am sorry, but Atari is doing the same strategy.

Where? There were no 7800 kiosks. There was no joint advertising.
There were no huge Lynx banners. There were no deals signed? You *ARE* wrong.

: > Really? Tell that to Apple III owners. And Lisa owners. They were
: > shafted nicely by Apple.

: Yes.. But Apple rebounded and is still in the computer business, unlike Atari.
: These flops were in the early 80's. Company's learn from mistakes unlike
: Atari.

Atari is doing what's nessescary to survive. And ... judging by
all the improvements on the Jag, Atari has learned from their mistakes. I
see commercials, I see a toll free line, I see Jag kiosks, I see dealer
videos, I see promotions and I see 3rd party games.

: Thats funny, there must be alot of pissed off Nintendo owners. meanwhile
: millions of units are still sold each year.

Millions of NES units? I doubt it. Nintendo has officially
discontinued the machine.

: What about the Apple III and IIGS? Mac users can ad the Apple II card if the
: need for Apple II software arises.

But Apple III (not II) users were stuck out in the cold. And the
massively overpriced IIGS was left out to dry.

: Just 45 games?

I can't afford more right now.

Body handling: HTML body converted to readable text

There's been enough Atari-bashing on here for a while. I've done some of it a few months back, I'll admit.

However, when is it going to stop? Why do I have to log on and, in-between the messages that interest me, read some jerk's continual forecast for doom (not the game, mind you) of Atari? I'm tired of it, and I really don't care. So what if they go broke...so what if they don't. There's nothing that can be said here that will probably have any bearing.

Why would an ex-Atari user stay on here, just to bash Atari continuously? Why not get on the Apple forum and bash Atari?? If you have a real problem with Atari and Ataris, to the point that you feel the need to continually flood the Atari forum with negative messages, perhaps you should consider the following:

1) Sell ALL the Atari stuff that you own, if any. (cheap, too)

2) Think about something else....baseball...Apple....Power PC chips.....the Brady Bunch...whatever.

3) Unsubscribe from the Atari forums. There's nothing that a bunch of posts like "Atari Stock now only $x.xx" can do here.

4) If, for some reason, Atari was to fold up, don't smile and pat yourself on the back, because you didn't have a goddamned thing to do with it. You've just been blowing hot air, and random chance has operated in your favor....certainly not insight/intuition.

James

Source record: 13790

: I think it is Andrew Welch from so and so software.

So and So? I think? This is not accurate, detailed proof, Peter.

: Why, he likes the Atari console.

How do you know that he's a developer.

: I have. I was on the Lexis-Nexis today and read an Atari Press release dated
: Sept.28, 1994 stating that 90,000 Jagflops have been shipped/sold.. Atari most
: likely sold about 60,000 Jagflops in Q4. This would confirm the statement by a
: n Atari VP. The Jagflop is not doing so well.

The first part, I believe. The second part I don't. Where did you
pull the 60,000 number from? Where did you pull the vp statement from?
Nothing concrete or official here. C'mon Peter ... you're ducking again.
Show me official proof.

: What about the other ones? Have they renew their faith?

Who knows? The fact that Activision is increasing production says
something. The production of MK III is another boost to the Jag.

: I have.. Read above. The Jagflop has been out for 16 months(480 days, give or
: take..This comes to about 312.5 units sold a day..These sales do not ven come
: close in covering Atari's expenses. So about 150,000 have been shipped/sold.

You have not given official proof. You've given heresay ... yet again.

: I have not seen any kiosks. For that manner, I have not seen a Jagflop for
: sale in Cedar Falls/ Waterloo. Plenty of SNES's and 3DO's..

I *HAVE* seen Jag banners, and Jag Kiosks and Jags for sale. In
Guelph, Ottawa and Toronto, Ontario.

: >: > Really? Tell that to Apple III owners. And Lisa owners. They were
: >: > shafted nicely by Apple.

: In what way? These owners went to the Mac. This time frame happened 15 years
: ago. Plus Apple provided monetary incentives for those who wanted to trade in
: their Lisa's and Apple III's for a Mac..

What incentives? I know of a few Apple III owners that got left
in the cold by Apple. And ... if you want to go that route, Atari did the
same thing. Atari allowed 8-bit owners to upgrade to the ST.

: Atari has not learned anything.. Product delays continue.

You can't read, can you? Every one is plagued by production
delays. Where the hell is the Sega Genesis modem ... announced in 1989.
Or the SNES CD ROM? Or the Color Gameboy? Atari HAS LEARNED. What do you
call the commercials? Kiosks? Toll-free Customer Service? Banners? Joint
Advertising? 3rd Party Developers? Don't duck this Peter. *NONE* of these
things were present on previous Atari consoles.

: I meant SNES.

I meant NES. The pattern will continue when Nintendo releases the
Ultra 64. The SNES is almost 2 years older than the Genesis, the Nintendo
is releasing the Ultra 64 the same time as the Saturn.

: Apple III users were given a monetary incentive to get a Mac. IIGS owners who
: did upgraded to the Mac transfered their Keyboard, Printer and Drive over to
: it because of the common connectors.

But they still had to buy a Mac. Until recently, Macs (and all
other Apple machines) were WAY over-priced.

: Atari has continously abandoned their customers.

8-bit owners were allowed to upgrade to the ST, through an
inexpensive tradeup program. 7800 users could play 2600 games on their
machine. The Lynx is connectable to the Jaguar. It's not as bad as you think.

Atarinet is a FSC (ie. fidonet style) based network. I don't know of any way to access it's message areas from an internet site. NeST and Turbonet are other FSC networks, which are better than Usenet for atari stuff IMO, but I don't think you can access them from the internet either.

Would you mind backing up this accusation with some form of proof, Sinclap?
You probably wouldn't since you don't have any. I have never said any
erotic things about your penis (a.k.a. "jagflop"). I CHALLENGE you to
prove that I have been sending you "erotic" e-mail!

>>And I know a lot of people who have NEVER bought *any* video game systems!
>>Your point, as Mark said, was stupid.
>>And I find it interesting that this is the only one of Mark's statements
>>that you didn't comment on. Sinclap ducks again!!

>What did I duck?

Mark's statement that your "I know a lot of people who haven't [bought
a Jaguar]" point was stupid because many people don't buy any video game
systems.

By conveniently ignoring this while responding to all of Mark's other
statements, you, IMHO, implicitly admitted that Mark was right in saying
that that particular point of your's was stupid. And your lame attempt
to address in your last post was too little too late.

>>As I remember, System 7 was late also.
>>And it Apple's R&D was "sufficient" for the Apple III, why was every III
>>shipped defective? Because it was poorly designed, perhaps? And Apple's

>releases on the Lexis/nexis with quotes by Sam Tramiel who is upto his old
>tricks. "The Jagflop cdrom will be available by June and that 30 games will be
>out by Christmas."

Apple is in general better at sticking to its schedules than Atari is.
I will admit that. But if Copland is the only product that Apple was
ever late with, than you mustn't know too much. They were also late
with System 7 and the PPC-based PowerBooks. That's *three* late products
right there. I have only been following Apple for the last five years,
so I'm sure that there are other examples.

Someone help me out on this. Name all the Apple product delays that
you can think of.

>The powerMac I wanted was not over priced, I just did not have the money for
>it. My all in one trinitron screen, 2x cdrom, fast 030, big size keyboard plus
^^^

68030 !!???!!
No one makes 386's anymore. Therefore, Apple shouldn't make 68030's anymore
either. If it wasn't for the PPC-upgrade option, I would say that you were
rooked majorly. For $1189 you can get a 486DX2-33, which I'm sure is much
faster than your lowly "fast" 030!

>over $1000 worth of software cost $1189 at Wal-Mart. I will be upgrading to
>the 75 mhz PowerMac one in May. I slide my mother board out and slide in the
>new PCI one. The alchemy will cost way under $2000 for a complete system.

Name the software. WE will decide if it's worth $1000.

>Meanwhile the Falcon 030 will chug along at 16 mhz and still cost $1299.

It probably costs less than that since it's been discontinued.

>>As soon as those new models and technologies come out that is.

sigh

It's been quite awhile since I last perused the articles on this newsgroup. Unfortunately, it looks like the same people are still bitching it out with each other...

"You're wrong!"
"No, you're wrong!"
"Oh yeah? YOU'RE wrong!"

sigh

And people have the audacity to wonder why I no longer actively support Atari any more. *shakes head* Folks, all sarcasm and bad feelings aside, grow up, eh? In the several months that have passed since I was last in the newsgroup, it seems like only the subject matter has changed. The logistics of those involved in these petty, worthless arguments have not.

You want to settle this Great Controversy? Fine. Get copies of the stock reports from Apple, IBM, Atari, Nintendo, Sega, and all the other players here. They will tell you everything you've been bitching to each other about; no more speculation, just plain fact.

Now...How about a little intelligent conversation?

Apple never publicly stated when the Powerbook(PPC) were to be released. Apple
talks to their developers about product plans and intro dates. Apple did not
issue a PR press statement that the new Powerbooks would be available by a
certain time. However, Atari's press statements have said on numerous times
that there will be 50 games avilable by Christmas, than issue another one that
30 would be available by X-mas and than not deliver. What 12 games available?
Atari issues numerous PR statements that the cdrom would be available by
November, Before Christmas, late December, late January, early February and now
March.
Sam Tramiel is a shameless liar who is constantly quoted and they are not true.

However, Apple issued a Press statement stating that Copland would be delayed.

250. Atari's and PC compatibles

Newsgroup: comp.sys.atari.advocacy
Date: 1995-01-30 08:19:10 UTC
From: pl4266@u.cc.utah.edu
Message-ID: <3gi7du$7r2@news.cc.utah.edu>
Source record: 13801

There have been some really good points made on this news group
about the important differences between Atari's and PC compatibles. I
believe some of these desereve recounting.

- Huge corporations do not produce software that benefits the user, they
produce software that will drive their sales, so if you buy from
Microsoft you have the best chance of getting inefficient software which
is so expertly engineered to eat memory and clock spped that you must buy
a faster machine with more memory.
-Atari's cannot be cloned without a proper license from Atari Corp.
meaning broad based compatibility can't be had for free like in the x86
PC world which was only possible because of lack of patent by IBM or
INTEL or both. This free for all is now ending with proprietary chips
such as Motorola designed PowerPC's and Intel pentiums. If you look
closely, you see the proprietary companies banding together against the
clone-makers. Intel started it's intel-inside warning label campaign so
that they can pull sales from clone makers who will no longer be able to
copy their processors. IBM and APPLE commissioned Motorola to design a
chip for their corner of the market so in the future they will be
set-apart from clone fakers who cannot build PowerPC's without paying a
license fee. IBM also manufactures the Jaguar under license from ATARI.
The only proprietary company not gearing up to combat cloning is
COMMODORE-AMIGA which is skating itself through thin-ice running circles
in court.
- Proprietary computers such as Macs, ATARI's and AMIGA'S have onboard
hardware and custom chips for graphics/ sound I/O of many kinds. Although
many of these machines have smaller numbers in the clock-speed column,
they are still infact more effective at certain kinds of processing than
computers twice their speed. Integrated hardware and DMA technology help
these computers take advantage of hardware efficiency that would be
faster than the "Software Drivers" used in ernest on PC's.
- Beyond hardware, it is true that computers like Atari, Mac and
especially AMIGA have had far more advanced operating systems much sooner
than many PC's. This is because people have thoughtfully pushed the
limits of the hardware instead of selling out the industry by fooling
people into believing they need expsensive upgrade hardware to do simple
home-user tasks. In the PC WINDOWS users world it is stark reality that
to get the performance equalling a 10year old 680x0 machine you must
spend much more, be much faster and have much more disk space than you
really need. The processor and disk size are only important because of
ominously shamefully lousy operating systems that everyone thinks are the
only alternative. It is planned to be this way, you by the world's most
speed/memory inefficient os and computer companies bless the name of
Microsoft because now they're selling you new hardware that you really

don't need to do what most people do with their computers! If you had a thoughtfully programmed OS in ROM like TOS/GEM or whatever then you don't waste disk space, you have icons and windowing that acts like a REAL operating system and you can do it with less speed and memory and still come out with more favorable results. Especially using AMIGA's very classic and someday history-making Multi-Tasking OS which came out in 1985 and gets the job done in as little as 256k because the programs are written to be lean and fast!

It is scandalous and incredibly distugsuting that people dance like marrionettes to the game of Microsoft and Compatible companies, spending exorbitant amounts of un-necessary cash to get a system that is completely impractical for home or even semi-pro computing, although very effective for Buzz-word contests and Ego stimulation. I suppose the smartest marketers are those who can make complete asses out of their customers and still have the beg for more, they must be laughing it up right now, all the way to the bank. It is true about the U.S. people buy what they're told they need and trends far dominate independent thought! Consumers should be the first priority and they can make themselves such by refusing to be insulted by corporate giants out to sell them off and they should buy something good.

None of my business <tm>, but Marconi seems like a strange choice, in that it's one of the most established trademarks in the electronics business. Haven't the owners (GEC?) anything to say.

Macaroni sounds much better to me. Like spaghetti, but kinda hollow. :>)

I know that this may not be the right place to place an ad,
however if anyone in the UK, South Wales, Mid Glam etc. area interested
then please e-mail me !

What I have for sale is :

Atari 520STFM computer with mouse,
Phillips CM8833 colour monitor,
Over £900 of software and games,
all cables and boxes are included.

I will be asking about £250 o.n.o.

Cheers all

Simon

257. Toad Computers Internet Support

Newsgroup: comp.sys.atari.advocacy
Date: 1995-01-31 19:28:52 UTC
From: "Toad Computers, Inc." <toad@charm.net>
Message-ID: <3gm31k$hua@canton.charm.net>
Source record: 13808

```
TOAD COMPUTERS ANNOUNCES INTERNET SUPPORT SERVICES 01/31/95
------------------------------------------------------------------------

Toad Computers is proud to announce online support on the Internet,
including a World Wide Web (WWW) homepage, an ftp site, and e-mail for
sales and technical support.

The World Wide Web homepage allows customers to get product
information (like Jaguar game screenshots and availability dates),
request a catalog, learn more about Toad Computers, and view Atari-
related graphics and animations. Right now, the Toad Homepage even
allows online ordering of some products, like clearance games.

In addition to resources specific to Toad Computers, the Toad Homepage
offers pointers (or hypertext 'hotlinks' as they are called), to other
Atari-related resources on the Internet including software archives,
newsgroups, and other Atari-oriented WWW homepages.

"We believe that the Internet is an important new medium," says Dave
Troy of Toad Computers, "and if it helps us to provide better service
to our customers, we want to be a part of it." While there is no
graphical 'Mosaic'-type WWW browser for the Atari, Toad Computers is
very interested in seeing one developed. According to Dave Troy,
"Hypertext Markup Language (HTML), the raw text underlying the Web, is
extremely straightforward. The tricky part of getting Web access on
the Atari is the TCP/IP connection that PC's can get using a program
like Trumpet Winsock. Once a PPP (point-to-point protocol) connection
can be made reliable, a web browser should be fairly easy to
implement." Right now, there are a few packages (such as
KA9Q/NOS/STNET/MintNet) which deliver PPP access on the Atari, and ZFC
(the makers of Edith Professional) have been talking about writing a
graphical browser. It is likely that before the end of the year,
software should be available to allow Atari PPP and WWW access through
a variety of local Internet access providers.

For now, to access the WWW homepage, Atari users will have to use
Internetworked PC's or Mac's equipped with a 'Mosaic'-type browser. In
addition, America Online (also accessible through Mac's and PC's),
will be offering graphical WWW access this winter. "It shouldn't be
too hard for someone to find a Mac or PC running Mosaic. Many Atari
users use these systems at work, and they can also be found on just
about any school campus -- from university to community college,
everyone is running Mosaic!," says Troy.

An ftp site is also available for Atari users to download files that
pertain to Toad Computers, such as our SYSINFO system & modem tester,
```

STraight FAX! support notes, and ordering information. Right now, CompuServe, America Online, and GEnie all offer limited FTP access, so users of these services should have no problem accessing this site. And of course, any machine on the Internet can be used to access this site using a conventional ftp client. The KA9Q PPP package for the Atari includes a built-in ftp client.

Toad Computers has always been available through e-mail, but Internet e-mail allows greater flexibility and faster response times. "With our e-mail on GEnie, it has always been a project to read it and respond quickly," says Troy, "and that has been particularly true with the huge volume of mail we received after mailing our most recent catalog."

If you have sent e-mail to the 'toad@genie.geis.com' address, please be patient; it will be answered. However, for an immediate response, please direct all e-mail to our new address, 'toad@charm.net'.

Toad Computers does not plan to stop visiting the Atari ST/Jaguar Roundtable on GEnie. "GEnie has always been a core part of our online support, and we appreciate the relationship we have developed with customers and developers there. We will continue to post specials and news files on GEnie, and we will also continue to be involved in the Bulletin Board areas," says Troy. And of course, any e-mail received at 'toad@genie.geis.com' will be answered. However, customers are once again reminded that response will be faster if e-mail is sent to 'toad@charm.net'.

Toad Computers Internet addresses are as follows:

WWW Page: http://www.charm.net/~toad/

Anonymous FTP Site: ftp://ftp.charm.net/pub/home/toad/
(ftp to ftp.charm.net,
go to pub/home/toad directory)

E-Mail: toad@charm.net

E-mail from GEnie: toad@charm.net@INET#
(@INET# instructs GEnie to use
their Internet e-mail gateway)

[snip]

Really? I thought Intel had that idea a long time ago. And, in contrast
to IBM, they had $2.3 billion earnings this year (and that's AFTER writing
off half a billion for the impact of the pentium bug, folks!)

Just kidding, just kidding...

Source record: 13811

Hello to all ST owners,
This is to tell you about a new game that is coming out on the ATARI
ST in the next few weeks. Here's what ST-Format had to say about it:-

HOLLYWOOD HUSTLER ST-FORMAT PREVIEW

PRODUCED & DISTRIBUTED
BY DESERT STAR SOFTWARE
MACHINES - ALL ST/STFM/STEs (1 MEG & ABOVE)
PRICE - TBA
RELEASE - MID-FEB

COMING FROM THE NEWLY FORMED DESERT STAR SOFTWARE, HOLLYWOOD
HUSTLER HAS TO BE THE CLOSEST THING TO INTERACTIVE VIDEO
WE'VE SEEN ON THE ST! YOU FOLLOW THE STORY OF A YOUNG
DAVID ESSEX LOOKALIKE, WHO'S ON A QUEST TO RETRIEVE HIS
WAYWARD GIRLFRIEND BY GAMBLING (SO THAT'S HOW IT'S DONE!")

COMPLETE WITH A CAST OF UNSHAVEN ACTORS IN ILL-FITTING
SHIRTS, HUSTLER COMBINES DIGITISED ANIMATION (FILMED ON
LOCATION IN HOLLYWOOD AND HULL ALIKE) WITH SAMPLED SOUND
TO A MORE UPTO-DATE FEEL TO THE GAME.

AT ITS CORE HOLLYWOOD HUSTLER IS A FIVE CARD POKER
GAME (THE FIRST LIVE-ACTION POKER GAME ON ANY FORMAT...
PC INCLUDED)... AND CONTAINS SOME SCENES THAT COULD BE
UNSUITABLE FOR YOUNGER AUDIENCES, BUT WITHOUT BEING AT ALL
OFFENSIVE OR EXPLICIT.... HUSTLER SHOULD BE REARING ITS
HEAD SOON!

FULL REVIEW IN NEXT ISSUE.

Now here's our press release/advert :-

"HUSTLER - THE CLOSEST
THING TO INTERACTIVE
VIDEO WE'VE SEEN ON THE
ST!"
ST FORMAT

"IT'S THE REAL THING!"
MIKE SINGLETON - AUTHOR OF THE
BEST-SELLING 'MIDWINTER' SERIES

THE FIRST FULLY DIGITISED COMMERCIAL
GAME ON THE ATARI ST/STE!

OVER 1 MEG OF INTERACTIVE SAMPLED
SPEECH & FX!

ORIGINAL HOLLYWOOD LOCATIONS

COLOURFUL CAST OF ACTORS WITH FILM
& TV CREDITS THAT INCLUDE
THE ROCKY HORROR PICTURE SHOW..
THE BEIDERBECK AFFAIR..
CONFESSIONS OF A WINDOW CLEANER
ETC.

SPECIALLY DEVELOPED ARTIFICIAL INTELLIGENCE
FOR TOTALLY COMPELLING AND WHOLLY
AUTHENTIC PLAY

ADVENTURE STYLE "CINEMATIC" INTRO, PLUS
THREE INDIVIDUAL ENDINGS

Runs on ANY standard ST/STFM/STE with 1 MEG & above.

Available shortly on Atari ST/STE and Commodore Amiga.
PC and PC-CDROM versions to follow.

For advance orders or wholesale enquiries please contact :-

DESERT STAR SOFTWARE
120 BURDEN ROAD

For sale a Commodore 1802 color monitor at $100. Good conditon no box or manuals, however, I used it with an Atari 800 XL then later as a monitor for my SNES and Sega. Yes I'm sure you can hook it up to a Commodore computer. It's a great monitor the only reason why I am selling it is because it takes too much room.

>>>in alt.sex.homo dude..

>> Would you mind backing up this accusation with some form of proof, Sinclap?
>> You probably wouldn't since you don't have any. I have never said any
>> erotic things about your penis (a.k.a. "jagflop"). I CHALLENGE you to
>> prove that I have been sending you "erotic" e-mail!

>You always ask: How is your penis? Need I say more..

#1) That is *hearsay*, not proof. Why not post one of these "erotic"
e-mail messages, Sinflop. And post a REAL one, not one of your
forgeries (and we will all be able to tell that it's a forgery just
from the grammar and spelling).

#2) Actually I asked "How is your jagflop doing?" not "How is your penis
doing?". Oops, forgot...the "jagflop" IS your penis, isn't it!? Sorry..

#3) Why have you been posting that your penis is a "flop" all over the net??
Are you really *that* disappointed in it

>>>>And I know a lot of people who have NEVER bought *any* video game systems!
>>>>Your point, as Mark said, was stupid.
>>>>And I find it interesting that this is the only one of Mark's statements
>>>>that you didn't comment on. Sinclap ducks again!!

>Duck what? The Jagflop bombed.....Get over it..

Read the above four lines carefully...you should be able to figure it out...
but then again, maybe not..

Read these three lines below carefully also. They should help you figure it
out.

>> Mark's statement that your "I know a lot of people who haven't [bought
>> a Jaguar]" point was stupid because many people don't buy any video game
>> systems.

>The Jagflop's installed base is around 150,000 worldwide.. Tens of millions
>own SNES, NES, and Genises. Over half the students in my previous residence
>hall had a NES and SNES.

Over half the students in your residence hall probably didn't even have a
video game system (I know none of mine ever did). Unless the state of Iowa
is video game crazy or something, that statement of yours is very suspect.

BTW here are four more lines to help you..

>> By conveniently ignoring this while responding to all of Mark's other
>> statements, you, IMHO, implicitly admitted that Mark was right in saying
>> that that particular point of your's was stupid. And your lame attempt
>> to address in your last post was too little too late.

>Oh well. many of your statements are pretty lame. About every post of yours
^^
>is attacking me and somewhat my penis(You can't have it - Get over it).

Your one to talk. How do you define "lame"?

Every post of yours attacks Atari and the Jaguar for no good reason.
There is nothing wrong with you hating Atari, but I see no reason why
you have to spend three years of your (non)live belittling the company
in Atari newsgroups. There are Mac groups, you know (to readers of
c.s.m.a and c.s.ppc, I apologize for directing the Evil Clapmaster to
your forums). And since you like the Jag, why do you want it to flop?

>Apple never publicly stated when the Powerbook(PPC) were to be released. Apple

It's common knowledge, though, that they delayed the introduction of the
PPC PowerBooks 6 months because 603's cache was to small for their emulator,
so they had to ask IBM and Moto to develop the 603+ (A 603 with a bigger
cache). I guess you could say that that was more IBM's fault than Apple's
but they could have informed IBM of the problem earlier than they did.

And the fact that they never publicly stated when they planned to release
them doesn't get them completely off the hook. A delay is a delay. They
never officially announced the release date of Copland either - they just
said "around late 1995" and then changed there projection to "mid 96". But
it's still a (BIG) delay, isn't it!?!?

As Apple has admitted, both Copland and the PPC PowerBooks have been delayed.

>talks to their developers about product plans and intro dates. Apple did not
>issue a PR press statement that the new Powerbooks would be available by a
>certain time. However, Atari's press statements have said on numerous times
>that there will be 50 games avilable by Christmas, than issue another one that
>30 would be available by X-mas and than not deliver. What 12 games available?
>Atari issues numerous PR statements that the cdrom would be available by
>November, Before Christmas, late December, late January, early February and now
>March.
>Sam Tramiel is a shameless liar who is constantly quoted and they are not true.

It's not the fault of Atari or the Tramiels that third-party developers are
late with releasing their games. Yes, they made a mistake in announcing
"50 games by Christmas", but they based that on what their third-party
developers told them...and what they told Atari turned out to be way to
optimistic.

>However, Apple issued a Press statement stating that Copland would be delayed.

That is correct.

>> No one makes 386's anymore. Therefore, Apple shouldn't make 68030's anymore
>> either. If it wasn't for the PPC-upgrade option, I would say that you were
>> rooked majorly. For $1189 you can get a 486DX2-33, which I'm sure is much
>> faster than your lowly "fast" 030!

>But not as nice..

Elaborate. How is a 030-based Mac nicer than a 486?

>> Name the software. WE will decide if it's worth $1000.

>ClarisWorks, Groilers encyclopedia, System 7.5, PC exchange, quicken and about
>eight cdtitles.

If that's the case, then Mac software is as overpriced as its hardware.
What are the 8 CD titles?

>> What will come out in May?

>PCI powerMacs. About six models..

'Bout time. PCI-based Pentiums will have been out for over a year by
that time.

Let me rephrase it: To get a Falcon that is useful will cost $1300.(minus monitor). Hell a Q630 4/250 can be had for $1049. A Performa 550 costs about $1199 from Office Depot.

Distribution:

: Were is your proof that I am not correct?

That is the *STUPIDEST* retort that I have ever heard. It's like
saying "I know you are but what am I." Hell Peter ... using your logic,
Apple will go out of business this year. Why? Because none of the people
in my residence hall are using Macs. They all use PC's. Sound stupid? So
does your retort. You're ducking the question again, because you don't
have any *SOLID* proof.

: Let me rephrase it: To get a Falcon that is useful will cost $1300.(minus
: monitor). Hell a Q630 4/250 can be had for $1049. A Performa 550 costs about
: $1199 from Office Depot.

I'll be the first to admit that the Macs are currently more
affordable than the Falcon. However, the term "useful" is being stretched
here. There are lots of things you can do with a one meg Falcon, if you
think about it. I'm sure the Falcon owners can come up with a nice list.

Your asertion that Amiga programs are lean and fast is misleading. Yes
many Amiga programs are lean and fast, but so are the ones for the Mac and PC
platform. Try running Lightwave on a 256k Amiga.

The last sentence is pure bullshit. I walk in Best Buy, I have a choice between
a Mac performa's or a PC. However, there is no ST and The Amiga in sight.
Who's fault is that. What's an Omega or ST(you figure Atari would of come up
with a better name).

Consumers should be the first priority and they can make
> themselves such by refusing to be insulted by corporate giants out to
> sell them off and they should buy something good.

I don't think the consumers are insulted as you think they are. You are pissed
off that the consumers did not buy the ST(and to a certain point the Amiga).
Atari Corp. screwed up: Atari did not advance the hardware/software in a
timely time frame, kept it a secret, screwed their developers, dealers and
spent next to zero on marketing.

The $799 base price for the Falcon030 is for the 4 Megabyte, NO HARD DRIVE model... virtually unusable.

Try pricing one with a reasonable amount of memory and a hard drive.

Now THIS one could be fun..!

What exactly can you do with a floppy based 1 Meg computer..?

How about... impress your technically ignorant mother when she comes over
to see you..?

Keep that old kitchen door from swinging shut and swatting you in the butt..?

Use it as a monitor stand for a REAL computer..?

Take a $799 tax deduction as your contribution to the "Send The Tramiel Boys
To Business School" fund...?

Letterman ought to get in on this one...
:)

Bollocks. I had a 4MB Falcon, and it kept running out of memory. If
you want a decent screen resolution, and NVDI/Speedo, etc, then 4MB is
pushing it, 1MB is useless.

I have 14MB now, it's a shame that 8MB isn't an option.

: The last sentence is pure bullshit. I walk in Best Buy, I have a choice between
: a Mac performa's or a PC. However, there is no ST and The Amiga in sight.
: Who's fault is that. What's an Omega or ST(you figure Atari would of come up
: with a better name).
:

This prove how ignorant you are. Amiga, not Omega is Commodore and ST
means Sixtenn-Thirtytwo. Speaking of choice, you have a choice between
Mac and PC because Best Buy or whatever decide that way, this not Atari
fault. And that is exactly his point. People follow the trends, Mac and
PC is hyp so they have to get their Performa or Aptiva and in six months
run to the same store to buy all the upgrade that cost sometimes more
than $200 just to have the latest version. Here is one rediculous
example, at work I use Corel Draw 5, it is full of bugs, even 5.02b and

the other day I recieved an ad for Corel 6.0. So what they want is the
customers keep paying them $200 bug every year.

: Consumers should be the first priority and they can make
: > themselves such by refusing to be insulted by corporate giants out to
: > sell them off and they should buy something good.

: I don't think the consumers are insulted as you think they are. You are pissed
: off that the consumers did not buy the ST(and to a certain point the Amiga).
: Atari Corp. screwed up: Atari did not advance the hardware/software in a
: timely time frame, kept it a secret, screwed their developers, dealers and
: spent next to zero on marketing.
: >

The good part of Atari Corp not come up every year a new version allow
developers to take full advantage of the machine. Take a look at Calamus
SL and QuarkX, I used them both on TT and Quad 950, well SL on TT is
faster and 'leaner' than QuarkX on Quad.

: I believe that Atari rep was the VP of marketing. So Atari failed miserably
: with the Jagflop..Oh well.

Still no proof, still relying on heresay. Get a life Peter. In most universities, you get laughed out of the place for citing heresay in your work. (ie. "Well, I heard from someone who heard from someone else - maybe an Atari VP, but I'm not sure - that the Jaguar only sold 150,000 units in all the world.)

If I were to use your logic Peter, I could come up with bigger numbers for the Jag. Hell ...

- A german magazine reported that 350,000 jags were sold in the US in 1994, along with 60,000 in Europe. That = 410,000 units. Of course, I only heard this from someone who read the magazine.

- Another netter reported 30,000 machines sold in France, 50,000 machines sold in the UK, 40,000 more sold in Germany as of Christmas 1994. Add to that, the 90,000 sold in the US as of February 1st. Not counting US sales sales during X-Mas or the sales in Japan, Australia and Canada, that equals 210,000 machines. Of course ... this is just heresay too!

: What console well come out on top in Q4'95'? The 3do?

Possibly. It's a good machine.

The U64?

I really doubt it - I've already said why.

The Saturn?

No. The 32X is standing in the way.

The
: Playstation?

A distinct possibility.

Or the sleeper, the Pippin?

Ha ha ha ha ha ha ha ha ha ha ha ha ha!!!! There is *NO* way this will happen. By the time Apple gets the thing out, it will be too late. Given Apple's introductory pricing scheme, the thing will likely cost a fortune. And ... since Apple computers are so popular in school, kids will be turned off by the concept of having an Apple game machine. Apple = School = Work.

Hey guys...This is gonna sound REALLY harsh, but I think it needs to be said.

Shut the hell up already!

It is quite obvious, I think, to everyone in this newsgroup that you two (and probably a couple others) are involved in a never-ending little whinefest which does nothing to benefit anyone here. I've only peripherally glanced over some of your respective postings and I find them almost completely devoid of anything resembling intelligent, logical conversation -- and frankly, I'm tired of it. It's bullsh*t, plain and simple, and belongs either in your own personal email accounts or in alt.whiners.post.here.

Unlike some of your more recent postings, this message is not intended to be any sort of personal attack. It's just a reminder that you're acting like little whining babies and it's really, really annoying without being beneficial to this newsgroup in any way.

Just my two bits...

Peter,
How about True Image or DAs Picture on the Falcon? These might
not be as powerful as Photoshop but they sure are less expensive!
ST is a decent name. Much worse than LC, right? Not much difference.
Of course, you must be desparate for things to complain about.
I personally like 'Falcon.' Has character unlike any machine made
by, um, Apple, for instance (IMHO).

Apple realises a great share of their sales in the consumer market with their Performa line. The Pippin is not being marketed as just a game machine. Try Education/Multimedia. Only time well tell..

I understand that the above is very buggy and not even close on par on what is
available on the other platforms. I am sure that software will surely advance
on a 16 mhz 030 machine... Get real..

The Atari OS resides in the rom chip. Very inconvenient when it's time to
upgrade. What upgrade? The Mac OS makes the Atari OS look like GEOS on the
C64. No comparison on features/functionality.

Yes, I had my share of Omega's thank you. Of course it's Atari's fault. Don't
blame the retailers. As for your bad experience on Corel Draw is prevalant on
every platform. What about Atari developers? What developers? Yes, at least
we have these problems but is not the norm. WordPerfect charges little like
$59 for upgrades. And same goes for Microsoft and Claris.

The Atari platform was never taken full advantage and this was the platform's
downfall. You obviously have not seen Quark and PageMaker on the PowerMacs.
How much does your beloved TT cost today?

I'm looking to purchase a copy of both GAUNTLET and GAUNTLET II
for the PC. I know its discontinued by Atari, so this is the only way.
If anyone out there has a copy or knows where to get one, please e-mail
any information! Thanx in advance...

Atari 16Mhz or 32Mhz with APEX can do a better job than your Mac that
cost three times more. With my TT and Calamus SL I can take you or any
other on the Mac to get the job done better and cheaper.

What incomvenient about that. The point of the author of the original
threat was that publisher made program that required the user to buy more
hard drive, Ram because the new upgrade required more and more RAM.

Well, I am glad for you. I know that I am not an idiot who wants to spend
$60 or so every year because the publisher didn't do his job right in the
first place.

I don't know, there is no need for me to buy another TT. And on the
contrary, the software on the Atari plaform took the full advantage of
the machine. Give me an example of a DTP software on Windows or Mac that
can be use on a 1 Meg machine. Ooops sorry, there is not enough ram to
run the OS.

Re: RAM for an ST...

If you have an STe, a RAM upgrade is no sweat.

If it's an earlier model then you need a hardware hack, as those models were NOT designed to be expanded.

I have a "solder in" RAM upgrade board in my 520ST which I can highly recommend over the kludge "solderless" upgrades, however I don't know if it's being produced any more.

The board was made by "Data Free", and I believe they were actually located in the Kitchener-Waterloo area. (I'm not at home at the moment, but I can look up the address on the company if it would help)

A good source of Atari info in the "general area" would be the Toronto Atari Federation... they're planning a big Atari show in the near future, and it's possible there may be vendors at the show that can provide RAM upgrades.

The above does not make sense. I can reverse: Mac hardware is less expensive
than the Falcon. The LC is called the Macintosh LC. 'LC' is syno. to the
education market.

Has character? So when is Atari going to advance the Falcon line.

Right now, a PowerMac 6100/66 8/350 costs $1689. Your beloved 16 mhz. 030
Falcon costs as much when outfitted with 8 megs and a good size HD.

How does a equivelent Mac system costs three times as much as a TT system. A
Q630 starts at $1050. Apple sells an 040 system called the Performa 475 for
$1099 that will put your tt to shame. As for software costs, I can pick up
PageMaker for $1199. So whats after the Falcon?

Excuse me, but I use low memory apps such as clarisWorks, Microphone lite and
so so on. As for extra memory and HD space is not a problem. A Mac system on
average comes with 8 megs as standard and a 350 meg HD and still is cheaper
than a Falcon system. If you need more memory, get Ram Doubler. Your knowlege
of the other platforms is limited..

Like adding more functionality. Isn't that what Atari developers do? Oh but
Atari users are cheap and demand the upgrades for free. No wonder the
developers went to greener pastures..

This memory issue is mute. I can run my Apps just fine on my standard 5
megs(10 megs with ram doubler) . For what I paid for my set up costed less

than a Falcon set up.

In the latest issue of the german atari-mag "Atari inside" there is an
article, that is really interesting.
They are saying, that already 12 companies bought a TOS-license from Atari.
So we can hope to see some powerful clones this year!

It still amazes me that some people still "can hope" for a future for atari
computers...whatever chance they once had, they blew...

|>

For a start, you could do anythig you could do on an ST. (except play
some of the games...)

On top of that, you can do audio processing etc. (although recording
would be a little impracticle.)

Not to mention play Llamazap - A great game from Jeff Minter/Atari.

: It has been widely reported at the recent CES show that a ATARI VP quoted
: 150,00. BobR confirmed it. What else do you want?

Christ! It's like talking to a brick wall!!!! Peter, *SHOW ME
PROOF*!!!! You can say "this person said this" all you want, but for all
I know, you could be making it up and so could your source. You are the
only person who has said this. I have seen no other people confirming.
Show me some E_Mail from an Atari VP backing this up, or a couple of
magazine articles or Atari stock information or something.

: According to a Atari press statement, 200,000 Jags will be manufactured in
: 1994.

That was a) back in September and b) for the US only. Atari could
have had more Jags manufactured (the Sega infusion came *AFTER* that
press release) and it's not counting sales in other countries. The US is
not the only country in the world.

: Nice to dream!

Yes ... you do it a lot - believing that your heresay is the law.

: Apple realises a great share of their sales in the consumer market with their
: Performa line. The Pippin is not being marketed as just a game machine. Try
: Education/Multimedia. Only time well tell..

I really doubt it. By the time it arrives, there will be too much
competition already.

```
%
% The Atari OS resides in the rom chip. Very inconvenient when it's time to
% upgrade. What upgrade? The Mac OS makes the Atari OS look like GEOS on the
% C64. No comparison on features/functionality.
%

a) The atari OS is on ROM, or you can load it from disk. Atari's own MultiTOS
loads from disk. Wrong again.

b) The atari's os is fully as complete as the Mac's. Granted you don't get
led by the nose to do anything, but that's a plus As far as I'm concerned.

Networking : put socket.xdd and nfs.xfs into C:/Mint and you can mount others
drives and export your own to your hearts content. Works over
ethernet, serial, parallel or midi.
Drag'n'Drop: Had it since time immemorial
Online help: Use the hypertext STguide
Multiple fs: put (say) minix.xfs into C:/mint and you can access a real file
system
internet : since the OS is basically unix, you can run any of the many
freely available unix tools for internet machines. Want your own
WWW site ? Simple, run httpd. Just like a unix box.
links : The desktop has supported 'aliases' for a long time - minixfs
supports it on the filesystem too.
expansion : simple - use SCSI. Same as the Mac.

Then of course, the OS is freely available in SOURCE form. Plenty of people
expand it and add more stuff to it, then re-release it. There is a clearing
house for new versions to be sent to, and you just download the latest version
from any FTP site. What upgrade you ask ? Well I've upgraded my OS around 12
times in the last year. Others might not want to do this, so they upgrade
less frequently. I think you shot yourself in the foot over this one.

BTW Pete, have you tried running X on a Mac :-) Laughable isn't it? Pity my
little old Falcon runs it nice and smoothly, if with not enough memory for
anything major :-( But VM solves that :-)

I reckon the Atari OS competes on a level footing with the Mac. It looks
just as friendly, and assumes you have-a-brain rather than the Mac's way of
`knowing' what is best.

Oh, and of course, *we* have fully pre-emptive multitasking with memory
protection and *we* don't have to reserve memory in advance because *we*
have real dynamic memory allocation. Pity the Mac doesn't isn't it ?
```

Then again, we're used to excellent free software from the FSF. Pity they've boycotted Apple. Is uppose that's why Linux-68k has an excellent X server available for it now (even before the amiga), whereas the mac... has Linux been ported to that arch. Yet ? I don't think so, but I'm not entirely sure...

Ah well, maybe in system 8,9, or 10 apple will incorporate all the benefits that running an Atari gives you today. Maybe.

Simon.

Why not???

>computers...whatever chance they once had, they blew...

They should have fired their managers instead.
But that is the problem.

You can compare almost any business with professional soccer,
with this difference:

when something goes wrong in a soccer game, the trainer and the
manager get fired.

when something goes wrong in a company, the managers stay and
someone else gets fired

What I am trying to say is: Atari could have made it with better
management, marketing strategies etc., but instead they choose
to fill their pockets and get out of the computer business.
Same for Commodore.

Well, I might try to respond here, but you seem to have summed up the
situation quite accurately:

> What I am trying to say is: Atari could have made it with better
> management, marketing strategies etc., but instead they choose
> to fill their pockets and get out of the computer business.

Atari had it's brief shining moment as "The Power Without the Price"
provider of computers. They blew it, probably for the very reasons you
cite. If they still provided value as they did in the late 80's, they'd be
selling 68040 boxes for $500. Too bad...

Stay the same or increase with the advent release/bundle of Quickdraw 3d for
the PowerMacs. Can't use Qickdraw 3d on the Falcon. - Info available on
Apple's gopher in the press release. Look for price reductions on the PowerMac
line soon..-Pentium machines will be down to the $1500 range as well.

This was obviously a typo. $550 is a typical mail order catalog price for PageMaker. (Sorry to contribute to a thread so far off the subject. I just couldn't resist responding to such obvious confusion.)

>>On top of that, you can do audio processing, etc.

>Umm... how much audio processing will fit on one 1.4 meg floppy..?

Infinite amounts, since "Audio Processing" on the Falcon is a _REAL TIME_
operation that consumes no more disk or ram memory than the program used
to generate the effects takes up. Now, if you want to save your processed
audio, then it becomes an issue.

>How many minutes of 8 channel audio will fit into 1 meg of RAM...?

Well, since this has nothing to do with audio processing, I don't think it
needs an answer.

>$800 to play Llamazap sounds a little impractical...

Tell that to 3DO buyers who paid $800 to play Crash & Burn when it first came

Geez. You all let *this* go by? IBM and Apple did *not* commission Motorola to design a CPU. IBM and Motorola worked together to produce a single-chip version of IBM's very good POWER architecture. Apple is in there because they needed to move beyond the 68K. The PowerPC is not intended to be proprietary; the intent is to license it to whomever wants to make it. The intent of the IBM/Moto/Apple alliance is to create an OPEN system/architecture, on which any number of OSs can run, under which software from any manufacturer will run, provided it it PowerOpen-compatible. As I understand, there is already a third chip manufacturer working on it's own version of the PowerPC CPU. There is the Taiwan consortium working to produce PReP/CHRP compatible motherboards. There is another US company producing PReP systems.

IBM learned its lesson with the original PC: this time it is not trying to maintain proprietary ownership of the system architecture. They wanted to create a new, open standard that would take the industry into the next 20 years. Clone-makers are welcome and encouraged to join in making PPC systems. Moto are making motherboards and systems. IBM are making systems. Groupe-Bull are making SMP PPC systems. The clone-makers are working on systems. They are all working to make them Power-Open-compliant, so that softweare that runs on one will run on all. IBM are working on offic minis and mainframes based on the PowerPC/POWER architecture, also Power-Open-compliant, so that software that runs on the desktop can be run on minis and mainframes when more speed, more I/O

bandwidth and/or more disk space are needed.

All the companies involved are working to keep the systems open and compatible. Industry and individual computer users have clamored for true open systems.

It will take time, but I do believe this dream will come to fruition.

Fester

STIRRE31@MAINE.MAINE.EDU wrote:
: Peter,
: How about True Image or DAs Picture on the Falcon? These might
: not be as powerful as Photoshop but they sure are less expensive!
: ST is a decent name. Much worse than LC, right? Not much difference.
: Of course, you must be desparate for things to complain about.
: I personally like 'Falcon.' Has character unlike any machine made
: by, um, Apple, for instance (IMHO).
: scott tirrell

I purchase my computers because they get the jobs I need done, done. I keep using them because they keep getting the job done. Not because they possess character. IMO ST _was_ a decent name. As _MY_ requirements of a home computer have grown, the ST has not been able to keep up. So what, I 'lumbered' myself with Intel hardware. All else aside, it works well gets done what is required of me. Word 6.0d, yeah, it just gets bigger, and slower if you don't upgrade the harware just as often as the software, but get this: I actually like using it! It has macros like software on the Atari platform can only dream of. I find it no less stable than That's Write on the ST. Sure I used v1.51, but I took the idea of upgrading to v3.0 OR Papyrus into consideration when deciding on what path to upgrade my computing capabilities. I tried TeX, graphics conversion programs etc, but being a chemist, at the end of the day, ST has software that is not upto scratch for my needs. MAC/PC does. I had little choice in my upgrae route. There are impose standards that I must follow. It just so happens that would never turn back: I find games/graphic/dtp and WP software far superior on the PC than on the ST - I did use Calamus SL, Geneva, Speedo etc so was using ST HighEnd software.

What really miffs me is that, or so it would appear, most non-PC owning individuals rant on about buggy PC software, upgrading it all the time and having to upgrade the hardware to match. That sucks. Get real. When I had my atari, I bought software and used it as was. Bugs and all. I didn't upgrade software and certainly not hardware to match - How many of you upgraded memory to run Speedo or MTOS, by the way?

Me, I got my machine now, and I get WP/DTP/Graphic software for it. It all works fine. If I need to upgrade hardware etc to get performance out of new software, THEN I BUY NEITHER. If it ain't broke, don't fix it. Just like you, I on't have the money to keep splashing out all the time.

Now on the suject of just how 'dandy' your Falcon is, how well does Linux/X11R6 run? On the PC, i've not had it crash ONCE, 8Mb ram it flies along. I now use dow/windows only for some work purposes, though there

is much neat recreational software around, much of it shareware. Linux provies a stable environment, with some very powerful software available. I think that it's neat that I can download UNIX source code and compile it as is and run it it on my PC under Linux.

And it's free, so none of these price arguements you all seem to love so much.

Regards,

An Ex-ST owner, and future Falcon-owner (when funds permit)

The future of Atari computing does not necessarily depend on Atari themselves, especially their hardware. The most important thing nowadays is the operating system. As ASH has programmed a completely TOS compatible operating system for Atari hardware and Macintosh hardware (Power PC to come), it is of absolutely little interest, wether Atari is comitted to their computer line or not (especially as they did and do no marketing for their computers). Atari computing will continue for some time, but it will be under the label of the "Magic" operating system.

: on a 16 mhz 030 machine... Get real..

This not true! The programs can easily compare to the Mac programs (well,
at least Repro and DAs Picture but not True Image). I know that, because
I hav been working with Mac, Winows and Atari programs (BTW, the mac
versions are much better than their counterparts in the Windows world.

: The Atari OS resides in the rom chip. Very inconvenient when it's time to
: upgrade. What upgrade? The Mac OS makes the Atari OS look like GEOS on the
: C64. No comparison on features/functionality.

I do not quite get your points. The TOS operating system from Atari
resides in ROM, true. However, the opearting system can be also run from
disk and harddrive. There exists an "upgrade" to the original Atari
operating system called Magic, a completely rewritten piece of software
whioch comes NOT from Atari. It has not only ENORMOUS advantages over the
original
Atari TOS, but also about Aplle System 7. (for example, preemptive
multitasking). And, last but not least, it is
available for Atari hardware and Macintosh hardware. It is actively
supported, so where is the problem? You can run now excellent pieces of
software also on your mac. You do not need Atari at all, to keep the
system alive.

Regards,

Alfred

No flames please. These may be interpreted as stupid questions...

1. Which Atari models are currently under production? Are the current models compatible with the prior models (1040 ST?).

2. I hate MS-DOS computers and Windows (I have to use them at work) and my old Amiga at home is dying and won't be repairable in a few months, I fear. Can anyone here tell me why I should consider an Atari rather than a Mac?

3. I recently saw a local ad for a used 1040 ST with monitor, HD, and the software collection of the owner for $300. Was this a good deal?

4. Is the Atari, like the Mac, easy to use?

5. Is there any future to the Atari, or is it dying a slow death like the Amiga?

The TOS-licence means that you build a machine around Atari's OS - not that
they are going to make Atari-type machines! TOS is needed to run all that
wonderful software that is available and developed. Atari's days might be
counted, but TOS lives, because people want good programs, and not any
mainstream standard shit.

>Apple's gopher in the press release. Look for price reductions on the PowerMac
>line soon..-Pentium machines will be down to the $1500 range as well.

Will this Quickdraw 3D have any use outside the Engineering community
(who, judging by Autodesk's decision to abandon the Mac market, have
little use for Macs)? And how the hell do you think that a mere 3D
version of Quickdraw will be enough to stave of the onslaught of Windows
96?? My gut feeling is that Windows96 will steam roll everything in
its path, including the Mac, and I don't even like Windows (a major
understatement). Apple better have more ammunition than that if it
wants to combat Microsoft.

I would hope that Apple would reduce Power Mac prices, especially that
of the grossly overpriced 8100-110; otherwise they will be blown out
of the water by all the Packard Bells and Gateways of the world. Besides,
is it really fair to force people to pay top dollar for machines that,
barring a $500+ upgrade, will be obsolete by this Summer when the PCI
Power Macs come out!

I hope you are right that the prices of Pentium-based computers will soon
go down to $1500. I want to buy a new computer to replace my aging 386SX,
and a Pentium should suit me just fine. BTW where did you get that info?
Inquiring minds want to know..

Re: audio processing...

Ah.. OK.. you're talking about standalone DSP applications for doing things like processing old vinyl records to take the hiss and pops out of the audio stream..

I can go along with that.. the applications should fit on a 1.4 Meg disk, and as long as both the application program and any audio buffer will fit in 1 Meg

of RAM, it ought to work...

Just curious.. how many of those applications are actually avaialable..?

```
: 1. Which Atari models are currently under production? Are the current
: models compatible with the prior models (1040 ST?).

The TT030 and the Falcon030 are in limited production. Atari is
pretty much out of the computer scene.

: 2. I hate MS-DOS computers and Windows (I have to use them at work) and
: my old Amiga at home is dying and won't be repairable in a few months, I
: fear. Can anyone here tell me why I should consider an Atari rather than
: a Mac?

I hate to agree with Peter, but there are very few reasons. The
ST is a steal on the second hand market and is a strong MIDI computer. On
the other hand, it's really out of the mainstream now.

: 3. I recently saw a local ad for a used 1040 ST with monitor, HD, and
: the software collection of the owner for $300. Was this a good deal?

It's okay. I've seen used 1040STe machines with colour monitors
and software for $150 Canadian.

: 4. Is the Atari, like the Mac, easy to use?

Yes. The interface isn't quite as nice, but it's a point and
click environment. On the ST side, the OS is in ROM, so there's none of
this "insert disk X" bullcrap.

: 5. Is there any future to the Atari, or is it dying a slow death like
: the Amiga?

It is dying, unfortunately. Macs will be next. As much as I hate
to say it, it's a PC world out there.

351. FS Atari compatible inkjet printer

Newsgroup: comp.sys.atari.advocacy
Date: 1995-02-09 00:00:59 UTC
From: mcginc@netcom.com
Message-ID: <mcgincD3pHDo.4HB@netcom.com>
Source record: 13699

I have a Star SJ 48 inkjet printer for sale. It works great and outputs really nice papers. It's a little slow when printing a graphic intensive file, but so is any inkjet. Originally it cost $400.00. I'm asking $200.00 for it. I have the manuals, box, etc. It will also work with PC/Windows and Mac.

Contact Rich Goward if interested. Email, or call
805/523-1386 after 6:00PM pacific time
818/841-9100 9-5 M-F pacific time

Thanks
Rich

I always thought that this is what they should do. Atari used to
be king of the MIDI market, but lost it when they focused their MIDI
resources on other sectors and failed. The ST is a terrific MIDI machine.
Perhaps they can try to rebuild that market in the near future. The
Falcon, for all it's faults excells in that area.

357. <ad> GUARANTEED CREDIT REPAIR BY LAW FIRM

Newsgroup: comp.sys.atari.advocacy
Date: 1995-02-09 10:06:56 UTC
From: ccapc@cyber.sell.com
Message-ID: <3hcpg0$i0l@panix.com>
Source record: 13706

Consumer Credit Advocates, PC
11 Pennsylvania Plaza, Suite 2101
New York, NY 10001
(212) 629-5261 (telephone) (212) 629-4762 (fax)
E-MAIL: ccapc@cyber.sell.com

Our LAW FIRM offers direct guaranteed effective credit restoration services by experienced attorneys. THIS IS NOT A DO-IT-YOURSELF KIT.

What can we do?

We have successfully facilitated the removal of Late Payments, Charge-offs, Foreclosures, Repossessions, Collection Accounts, Loan Defaults, Tax Liens, Judgments and Bankruptcies from our clients' credit reports. WE GUARANTEE THAT YOUR CREDIT CAN BE RESTORED!!!

Who needs our services?

Anyone who has experienced the inconvenience and embarrassment of being turned down for a credit card, a lease or a purchase of an automobile.

Anyone who is unable to buy the house of their dreams due to denial of a mortgage application or who has to pay thousands of dollars more in mortgage interest than someone with good credit.

Anyone who has been turned down for a job or promotion due to derogatory credit items on a credit report.

Anyone in business who has lost a deal because a person or firm wanted to see his/her credit report before doing business.

Anyone who has been unable to establish credit.

THE FOUR GREAT MYTHS OF CREDIT:

Myth #1: It is illegal or immoral to have your credit report cleared.

Fact: It is not illegal nor immoral. In fact, that is what the Fair Credit Reporting Act is all about. The act was enacted by Congress in 1971. One of its purposes as to give consumers the protection of the law and to help guard against

any unwarranted invasion of a consumer's right to privacy.

Myth #2: The information on a credit report cannot be changed.

Fact: Actually, the opposite is true under the Fair Credit Reporting Act. Federal and State laws require that items be removed if they are not 100% accurate or cannot be verified in a timely manner.

Myth #3: It is impossible to get a bankruptcy off a credit report.

Fact: Bankruptcies can come off credit reports like any other derogatory item. The nature of the derogatory item has nothing to do with its removal under the Fair Credit Reporting Act.

Myth #4: Credit Reporting Agencies are empowered with some kind of governmental authority.

Fact: Absolutely Not!! They are simply large corporations whose primary goal is to make a profit like any other business.

If you have ever applied for or received credit, a file exists in one or more of the credit bureaus. These companies collect, store and distribute as much credit information as they can find, retaining negative information on a credit report for 7 to 10 years. This information is evaluated by potential creditors to determine your credit worthiness.

Credit reporting agencies are in business to protect the interests of the creditors. the LAW FIRM's goal is to help and protect the individual consumer from inaccurate credit reporting.

The president of our LAW FIRM has been practicing consumer law since 1984. The staff of our firm has successfully processed, disputed and challenged thousands of client credit reports.

Our legal fee is based o the number of negative items that appear on a client's credit reports, issued b the three national credit bureaus. Our retainer agreement offers a MONEY BACK GUARANTEE stating that if any negative item is not deleted, upgraded or corrected from a client's credit file, it will give the client a full refund for that item or continue to process the client's file at no additional fee until that item is

corrected, upgraded or deleted. THE ONLY THING YOU HAVE TO LOSE IS YOUR BAD CREDIT!!

PLEASE CONTACT THE LAW FIRM AND LEAVE YOUR FULL NAME, MAILING ADDRESS AND TELEPHONE NUMBER SO WE MAY FORWARD FURTHER INFORMATION AND INSTRUCTIONS TO YOU ABOUT OUR SERVICE.

1> There are no Atari Computers in commercial production.

Compatibility is variable depending on the model and the version of TOS

2> You should consider a new Atari purchase instead of a Mac, if:

You dislike being able to buy software locally, and prefer to mailorder
ALL of it from one or two sources.

You enjoy having a lot of the documentation for software written in
German.

You don't want updated versions of programs, and like to use software
which was last revised years ago by companies which are long out of
business.

You're satisfied with the hardware you have, and don't care that
hardware upgrades, if available at all, can cost thousands of dollars.

You can fix anything that breaks by yourself.

You don't care about playing games that are newer than about four or
five years old.

There's more, but you get the idea...

3> With monitor and hard drive, $300 isn't a bad price.

A 1040 STe would be better, as the memory can be easily upgraded.

4> The Atari ST is very easy to use.

5> The Atari Computer line is not dying a slow death. It's already dead.
The body just hasn't stopped twitching yet. For those of us who already
have Atari systems, they'll continue to do what they do until they stop.
I would not recommend that anyone new buy one without a very clear
understanding of what they're getting into.

The Atari ST is my favorite of all the computers I've ever owned. It was an
excellent system when it came out in 1985. It was fast, and relatively
inexpensive, and fun to use. Unfortunately, this is 1995.

Steve,
You obviously use your computer for more professional uses than I do. I am a student at the University of Maine and mainly use my computer for word processing and DTP. I use AtariWorks and Pagestream and both work quite fine. Considering that I do not need oodles of software choices (and have little money to buy any) the Atari is just fine for me. And since I do not need a screaming fast system "character" is a consideration. I want a fun system to use and a Falcon is it. A PC is not fun IMHO. My friends think it is fun to play pirated copies of Doom, sure, but since I buy my software there are enough nifty Falcon games out there (more than I have money for).
As far as Linux goes, there is a version for the Falcon but I have no need for it and would rather not attempt to install it. I have a feeling that a novice like myself would have trouble with Linux.

Is Atari dead or dying? Sure. Will the Mac be next? Depends on what you call dying. Apple is moving away from the proprietary HW market to become a player in the OS market. Think about a PREP computer which would allow you to run MacOS, OS/2, Windows, TOS (MagicMac), Unix, or just about anything else you can imagine. Why would you not buy into this? It's a new paradigm. We're on the verge of an age of hardware irrelevance...if Intel chooses not to play on this field, their days are numbered.

This marks the end of the Mac as we know it, but a preservation of the Mac way of doing things. A similar analogy applies to Atari.

Source record: 13714

I hate to say it, but I was wrong. My yearning for official proof on the Jaguar's success led me to conact Atari Corp. directly. I contacted Don Thomas because he's not the type of person to butter bread like other Atari employees. He's always honest, even when the truth hurts. And this time, it does hurt. The Jaguar base is around 125,000 machines.

While I think the Jag is a fine machine and that Atari did put a good effort into it, it is a flop - even by their standards. Perhaps things can change, but it's really facing an uphill battle.

When the Lynx was first released, it outsold it's entire test market of 80,000 units in less than one day. The machine has sold more than 1 million units around the world. The 7800 has sold over two million machines. Both were considered disapointments.

So what went wrong? Anyone willing to offer suggestions? By other standards, the Jag is better supported and better advertised than other Atari machines. My guess is that Atari's burned too many past bridges and it's too late to fix things.

People can harp about Atari not changing from before, but they really have. Atari spent $300,000 advertising the 7800 over four years. They've spent tens of millions on Jag advertising. Two years after it's release, the Lynx had 16 games. The Jag has that many after one year ... with many more in development.

The 7800 had three 3rd party developers ... Activision, Absolute Entertainment and Froggo Games. The Lynx also had three ... Shadowsoft, Telegames and Beyond Games.

The Jag has a lot. Atari has bent over backwards trying to get people to sign up ... and they have had some success. I would have killed to see Jaleco, Williams, Ocean, US Gold, and any of the dozens of active Jag developers write for my 7800. Atari has also helped dealers out better than in the past ... joint advertising, banners, kiosks, dealer tapes.

It's a shame that this "improved" Atari didn't start a couple of years earlier.

The PowerMac 8100/110 is aimed at the prof multimedia crowd who have the money.
It's only offered in one config. However the 8100/100 is offered in many
configs and significantly cheaper. The 8100/110 is a safe investment for those
who have an investment in Nubus boards and will not be upgrading to pci right
away.

: Is Atari dead or dying? Sure. Will the Mac be next? Depends on what you
: call dying.

Well, Atari Corp is still in business. There are still machines
being manufactured in small quantities and software is still being
written. To quote Monty Python "Not quite dead yet ..."

: This marks the end of the Mac as we know it, but a preservation of the Mac
: way of doing things. A similar analogy applies to Atari.

I never thought of it that way. However, I've begun to notice
that many stores that were carrying Apple products aren't any more.

And Besides, you can do pro quality Direct to disk recording and
Digital Effects with a Falcon and Cubase Audio (that's 16 tracks, Man)
something which CANNOT be done on any other platform without buying
unreasonably exspensive hardware to add to your Mac or PC or whatever.
Did I have to buy a DSP card for my Falcon? Nope
Did I have to buy a MIDI interface? Nope!
Did I buy a LocalTalk card for my Falcon? Nope!
Did I buy a SCSI card (like I would need on a PC to use my syquest)? No Way!
Did I buy a Graphics Card to get 16+ Million Colors? No!
Did I have to buy a Mouse and Drivers or Game ports? No.
Do I have to buy extra hardware to connect my Falcon to a TV? No!
Can I take my Damn Hi Density Floppy out whenevr the Hell I want to?
YES!
Can I connect a standard SVGA monitor to my Falcon..Yes...
I use Macs and PC's just as often as my Falcon and I'd rather use a Mac
any day than a x86 or Compatible machine running anything by MS but my
Falcon is really alot more user useable than the MAC. If a Mac were like
a ferrari and a PC like a LEXUS I'd still drive my Honda Scooter, Cause
it's my style and I can feel the breeze, drive the freeway with less Gas
and lower insurance and still go 75 MPH, It looks cool and it's a lot
more fun! Besides it's easy to park.
I own a Falcon because it is the only piece of hardware that can
do what I need it to do at the cost I can afford, Direct to Disk
recording would be completely impractical and much too exsensive on
anything else. I didn't need to comparsion shop, I know very well what a
MAC can and Can't do well. There's now comparison for the level of depth
and developpment involved in Illustrator or Photoshop, they are
formidable programs, and Mac knows how to market and carry their users
over to new platforms , yet still retain them. It was brilliant to
emulate with PPC to beable to offer tons of 68k software immediately
useable on a completely new computer. Mac has offered great deals on
systems with lots of memory, diskspace and even built in CD rom. I would
have spent $2300 dollars on a MAC instead of my Falcon system (with
Syquest and Cubase Audio) and my Falcon still has only 4MEG ram! (by the
way where can I get more RAM for my Falcon, no dealer where I live,
please help EMAIL Paul.Luscher@m.cc.utah.edu) See how hard it is to own
an underdog brand? Yet ATARI thoughtfully included a few extra processors
in the Falcon that make its price 1/3 the same set-up on a MAC or PC for
my admittedly specific Direct to Disk needs.

You should probably start...Atari computing has always represented a particular way of doing things...it really isn't HW or SW or the brand name on the computer case...Atari is never going to sell a PPC based TOS system...but that doesn't mean you can't have one.

> However, I've begun to notice
> that many stores that were carrying Apple products aren't any more.
>
Everything's local...here in the northeast US the computer superstores are carrying Mac HW and SW in a proportion greater than the Mac market share, a phenomena being repeated in non-computer retailers as well. It seems that Apple is concentrating on large retailers rather than the corner computer store.

There's also been a resurgence of Apple in the eduacational market...some of the deals they offer to educators are fantastic.

You've hit on the real reason to buy computers...to do something. You also hit on the real reason to select a particular platform...because it does something better than the others. Blind loyalty is foolish and impractical. Calm rationality will lead you to the correct choice...find the best application for your purposes...then buy the HW and OS which run it cheapest and best...even if it is from Atari...

I think a distinction has to be drawn between "Atari is dead" and "Atari product xxxxx is dead".

When criticized for the way they do business, Atari will often reply, "Oh Yeah? Well, Xxxx Corp, one of our competitiors, is out of business.. we're still here"

When people say "Atari is dead", I think they often mean the "Atari Jaguar is dead as a viable product in the marketplace".. (substitute Lynx, Atari ST, or whatever, as appropriate).

In reply to criticism over the failure of the Atari St, Jack Tramiel said (and here I'll have to paraphrase, since I don't recall the exact wording of his statement) "Atari is not in the business of making computers, Atari is in the business of making money".

In a personal respect, he's certainly correct there... he's made a LOT of money from Atari over the years.

It also demonstrates the kind of committment to an individual product we can expect to see from Atari, and goes a long way toward explaining the string of failures we've seen from them.

Incidentally, today Darryl Still, of Atari Europe, mentioned that the total worldwide sales of the Jaguar included 125,000 units in the US, 30,000 units in the UK, and 30,000 units in Europe.

Atari recently announced that they were to begin selling the Jaguar in Japan, but so far no one has said anything about whether this has begun, or mentioned any sales figures if it has.

As a "quote without comment" for contrast, a sidebar in "Wired" recently mentioned that PRE-RELEASE sales of "Donkey Kong Country" for the 16 bit Super Nintendo Entertainment System were 2.2 MILLION units.

I heard some encouraging news from Don Thomas today ... that the
figure he gave me was old and incomplete. This is a plus for Atari ...
perhaps they did reach their sales goal after all. 125,000 units in the
US plus 30,000 units in the UK, plus 30,000 for the rest of Europe equals
185,000 units overall. That's not including sales in other countries like
Canada, Australia, and Japan.

Robert J Goos <goos@badlands.NoDak.edu> wrote:
>1. Which Atari models are currently under production? Are the current
>models compatible with the prior models (1040 ST?).

Atari does not make computers any more, but Falcons are available on
demand, and there are third party machines arriving (not clones but
machines which run TOS software), like Medusa, Eagle and C-lab Falcon.

>2. I hate MS-DOS computers and Windows (I have to use them at work) and
>my old Amiga at home is dying and won't be repairable in a few months, I
>fear. Can anyone here tell me why I should consider an Atari rather than
>a Mac?

Don't get any computer unless you find you find out what do you want to do
with it: first, find programs you want to use, and the find a computer
that runs the required software. Cubase Audio Falcon is a good reason to
buy a Falcon - all other software is available (and very good), but it's
an effort to find it if you don't live in europe and know the right people.

>3. I recently saw a local ad for a used 1040 ST with monitor, HD, and
>the software collection of the owner for $300. Was this a good deal?

IMHO anything but a Falcon, Eagle, Medusa or TT is not a good deal when
talking about TOS- computers. 1040's and STe's are doomed, and they lack
important features like VGA support and SCSI. Ste might be a good choice
for normal sequencing job, though.

>4. Is the Atari, like the Mac, easy to use?

Atari's operating system is simpler, but as effective as Mac's for doing
everyday jobs. Programs for TOS 4.04 and Falcon are very well designed
and full of functions. IMHO the quality of Atari shareware programs
is higher that many commercial Mac programs (examples: Connect 2.46e,
Two-In-One, Gemview 3.10, 7Up, JV-1080 editor). Don't get a machine
with TOS 1.0, 1.2 or 1.4, those old OS's are too simple. TOS 4.04
makes programs look better and run smoother. You have a good choice
of replacement desktops (Gemini, Ease, No!Desk, Kaos, Neodesk) to
get the "touch" you like (maybe some PS/2 -look & UNIX shell...?).

>5. Is there any future to the Atari, or is it dying a slow death like
>the Amiga?

Atari (clones) is going to survive as a music computer and maybe also
as a DTP/graphics design system. Get Atari if you do musical stuff
(digital audio/MIDI: Falcon) or DTP/Graphics (Eagle/Medusa/TT).
There are all the other programs (and very good!) available, but

it takes some effort to find them and to find support for them.
Net helps a lot as the "Atari community (europe)" is very virile and
helpful).

I seem to have missed the original posting, but if I understand correctly, the question is what Ultima and Bard's Tale games were supported for the Atari computers. Until a few years ago, I was playing Ultimas I-IV and Bard's Tale I on an old Atari 800 machine. I don't know if they're still available or not.

>

I am all in favour of 3rd parties developing new machines (Medusa_drool!), but
I want to know why Atari didn't do more for the existing range of machines when
they were doing well.

The other problem Atari have never cured is marketing.

I bought a TT in 1991, at considerable expense, only to see Atari do everything
except deny existence of the machine. When the Falcon came along I didn't see
this as an upgrade, slower clock speed, built in keyboard, no VME port etc. So
I decided to wait for the much promised Falcon 040!! [Picture an old man with
a long grey beadr sat outside Silica refusing to move until the Falcon 040 is
released].

I have stuck with Atari since 1987 and see no reason to change my TT for a PC
but I will be seriously considering both the Eagle and Medusa machines.

James,

Back when I subscribed to comp.sys.amiga.advocacy I read millions of
"Amiga is Dead," "Commodore stock is falling," and "AMIGA SUX H0H0H0H0!"
posts. They all made me sick. In between intelligent posts, I would
always throw in a plea or two for these posts to halt. After months of
posting these requests, I realized that they are inevitable -- they just
won't go away.

I learned to ignore these rediculous scribblings in time. The majority of
them were composed simple to introduce excitement into the pathetic life
of the author via flames. "Typical PC/MAC user." :D

Keep in mind that not everyone who predicts Atari's death hates the
machine. If you ask any (ex)Amiga user what they feel killed out beloved
machine, the majority will tell you Commodore management screwed it up.
It's true.

My advice: ignore the posts. If the group overflows with these flames or
exaggerated points, wipe it off your list.

Am seriously considering purchasing a BROTHER HL 630 Laser printer.

Need to know:

1. Are printer drivers available to run from an Atari
1040 Ste?

2. What is the best price/sale price anyone has seen
currently? Especially Southern Ontario/Canada.

3. Anyone with an Atari running this Laser printer, please
write me direct to: jim.gain@primetime.org or in
ATARI_ST, or Atari-ST.

Thanks.

Just out of curiosity: what the hell _is_ in the 2 megs of ROM the Mac
has? It surely can't be the OS, as it would be "inconvenient when it's
time to upgrade".

>The Atari platform was never taken full advantage and this was the platform's

Well, one can upgrade a usual ST/STe to run faster than a TT, and graphics
boards are also a possibility, but this will be more expensive than a used
TT or already upgraded used machine.

396. I'll trade 3 of mine for 1 of yours!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-02-12 01:15:51 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3hjng7$2gs@ccshst05.cs.uoguelph.ca>
Source record: 13647

Hi!

I have received *MANY* offers to buy and trade for the cartridges I'm offering. Unfortunately, not many people seem to be hitting the right keys. So, I'd like to change things a bit. To those of you who have already arranged deals with me, your cartridges have been set aside. The following items are still up for grabs:

Atari 7800 Atari 2600
========== ==========
1. Super Huey UH-IX 1. Kangaroo
2. Impossible Mission 2. Pac-Man
3. Fight Night
4. Touchdown Football Sega Master System
5. Real Sports Baseball ==========
6. Choplifter! 1. Hang On/Safari Hunt
7. Karateka
8. Galaga
9. One On One Basketball
10. Hat Trick
11. Centepede
12. Galaga

I will trade any three of the above games for one of the following:
^^^^^^ ^^^

Atari Lynx: Atari 7800 Tandy CoCo III
========== ========== ==========
1. Klax 1. F-18 Hornet 1. CoCo Max III
2. Dracula: The Undead 2. Water Ski 2. Max 10
3. Lemmings 3. Tank Command 3. Robocop
4. Ninja Gaiden 4. Tetris
5. Gauntlet III 5. Super Pitfall
6. Dirty Larry: Renegade Cop

My only conditions are that all games must have instructions and be in working order. If you want to make a different offer, please feel free. I'm fairly flexible.

Thanks!

Far off? About what? Do you really think that built-in 3D rendering in
itself will set the world on fire? It seems to me that only a handful
of specialists will be that interested in it. Win96, OTOH will finally
throw off (to a large extent at least) throw off the 16-bit shackles that
have plagued PC software for 10 years. That, backed with Microsoft's
extraordinarily effective hype machine, has a very good chance of setting
the world on fire.

I see. So the 8100/110 is aimed at professional multimedia users with deep pockets and low price sensitivity. Of course, if these people have so much money, why WOULDN'T they want to upgrade to PCI cards right away?

>>I hope you are right that the prices of Pentium-based computers will soon

Good. Assuming the cloners decrease their prices accordingly, it looks like I will be getting a new computer soon.

As for Apple matching the prices of the top-tier clone makers, if by "top-tier" clone maker they mean IBM and Compaq, their prices will still be relatively high.

From: trauth@paul.rutgers.edu
Message-ID: <3hlq1q$dig@paul.rutgers.edu>
Source record: 13651
Cross-posted to: comp.sys.atari.advocacy,rec.games.video.atari

I just read Mark's "I owe Bob and Petey an apology" post, and in it he stated some very bad news: That the Jaguar user base is only 125,000 people. Considering that the Jag has been out for over a year, that Atari went all out in their promotion of it, and that other video game systems like SNES and Sega Genesis have millions of users, a user base of only 125,000 people is quite miniscule. If things don't turn around soon, the Jaguar will be, as Peter so eloquently puts it, a flop.

So, with this in mind, I have one question: What will Atari do if the Jag fails? The only possibility I could think of is that they could become a PC clone maker and start churning out "power w/o the price" Pentiums. Anyone else have any ideas?

* Tom Trauth

```
: I just read Mark's "I owe Bob and Petey an apology" post,
: and in it he stated some very bad news: That the Jaguar
: user base is only 125,000 people.

Actually Tom, that number is incorrect. Don Thomas wrote back and
said that the actual number of Jags sold is larger. That figure was for
the US and was an old figure at that. Atari's user base is at least
200,000 units (this from several sources) and probably larger.

: in their promotion of it, and that other video game systems
: like SNES and Sega Genesis have millions of users, a user
: base of only 125,000 people is quite miniscule. If things
: don't turn around soon, the Jaguar will be, as Peter so
: eloquently puts it, a flop.

While I hate to use the word flop, the Jag is a disapointment.
Still ... the CD-I and 3DO picked themselves up. Anything is possible.
There are a *LOT* of games in the pipeline. People often forget that it
takes a year to program a game and the 3DO developers had their kits a
year before Jag developers. I think most people would agree that the
Jag's achilles heel is it's small library of games. There are enough
games in the pipeline that will help Atari in the long-run if they can
keep the Jaguar afloat until then.

PowerMac 8100/110 comes in one configuration: 16 megs ram and two gig's of
storage space. Plus Apple can extract a premium because of the low volume of
the 110 mhz 601. And than there are other PowerMacs at various price points.
There is going to be atransition time for people converting their Nubus boards
to PCI ones. Not everyone will upgrade right away. I just seen the specs on
the summer release of Nitro, TNT, Catylist and alchemy.. This line up will
hold off any Wintel 96 threat..

: BTW Peter, what do you think will happen to Apple's stock when
: Windows 96 comes out?

I know its kinda out of topic, but I have no doubts it will send
Apple's stock SOARING, as well as a huge influx of funds to NeXT. It will
be a year late, and will come nowhere near meeting people's expectations,
nevermind being "as good as a Mac!".
At this point, people will abandon MS/Intel like rats from a
sinking ship, and seek refuge in a true user interface, such as the one
provided by Apple for personal computers and NeXT for workstations.

: several magazine ads in which PageMaker for Windows is listed at about $500.

: His Cluelessness,
: >-Peter

Err, I hate to break this to you, but your little friend is
wrong. Pagemaker/Mac can be had in the latest PowerPC version for $299.
It is listed here quite plainly in this month's MacUser, in any one of
the myriad mail-order houses.

>It never went anywhere.

How hard did they push it? Maybe they were preoccupied with the ST
and didn't pay much attention to their clone line.

>Eventually they did sell a few 80386 clones in Canada and Europe, but that
>only lasted a very short time.

>If they can't sell the most advanced video game system in existance, how
>are they going to sell "just another clone"...?

Well, the advantages to selling "just another clone" over a new video
game system is that the software is already their. In selling clones,
they wouldn't face the "It only has 12 titles" problem that has plagued
the Jag. All they have to do is make a half-way decent clone, stick on
it a low price tag, market it correctly (something they may have problems
with) and get the right computer store chains to carry it (which they
will definitely have problems with, though hardly insurmountable ones).

I mean, what would be easier: selling "just another gas-powered car" or
an advanced new car that ran on alcohol?

```
: 1. Why do you like your Atari computer?

My 130XE is:

a) Cheap
b) Has lot's of software
c) Is a funky little machine

: 2. What does your Atari do (or do more efficiently, elegantly, etc.)
: better than other platforms (particularly Windows or Mac)?

It's not really better, but it is less expensive ... that's why I
love it. The software & hardware can be had for next to nothing. The
130XE can be purchaced for less than the cost of a sound card needed to
give PC's comparable sound. I use it for Word Processing,
Telecommunications, Graphics, Programming, Music and of course, Games.

Cheers,

Hi..

I'm looking for an Atari 800XL with power supply and floppy drive.
I know it's an old machine, but it was my first "real" machine...

If anyone knows where I can find one reasonably priced (I called
Best Electronics, and they want $99 (?!?!?!) for one...) or
will sell one for a decent price, please e-mail:
anna@wam.umd.edu

Thanks for all help!

The Atari 8-bit Omnibus is still available, now with a money back guarantee.
This ad-stravaganza filled with products for the Classic Atari costs only
$5 per copy. That includes worldwide shipping.

The Guarantee:
==============
If you don't like it/find it boring/think it's not worth $5/etc.,
just send me a letter with your name and address, saying what you
don't like. KEEP the magazine! I'll write back, apologizing and
including a cheque for your $5. Good enough?

Current Notes called it "...a nice piece of work...a neat idea..."

Comments on comp.sys.atari.8bit have included "Check it out!" and "Shell out
five bucks and get a copy of the Omnibus." Who am I to disagree?

So c'mon and try it!

The Atari 8-bit Omnibus
PO Box 342
Cote-St-Luc, QU H4V 2Y5
Canada

[Canadians can pay in Canadian funds. All others please pay in US $]
[If paying by cheque or money order, make it payable to David A. Paterson]
User group special pricing: $4 per copy, minimum order 5 (five) copies.

Robert,
I use an Atari Falcon030 and enjoy it for many reasons. First of all, the people in the Atari community are just great. If you have a problem with anything just post something in the Atari group to see what I mean. Also, go to an Atari trade show if possible. Because software companies in the Atari world are small, problems with software are usually discussed with the author of the program. This is much nicer than huge software companies in the IBM/Mac worlds, IMO.
I also think that TOS 4.04/GEM is the nicest desktop environment I've seen for any personal computer. It is very much like System 7 (IMO) and in ROM so that it does not take up gobs of system memory. It is the most user-friendly desktop that I have seen. Also, MultiTOS offers pre-emptive multitasking. Hopefully, magix for the Falcon will arrive soon for an alternative to the admittedly slow MultiTOS.
Software prices for the Atari market are, on the whole, much less than for PC or Mac. Upgrades are also generally much less. Furthermore, software seems to be much more efficeint on the Atari. Some will argue that software on the Atari just is not as powerful as software on the IBM but I find Atari software does the job.
Finally, I still argue that the Atari platform has "character." It is off the beaten path and this is good. I believe that personal computers are just that- personal. I don't need Microsoft to tell me what I need and I am very sick of people who believe the only platforms on the planet are Windows and Mac. Many people ask the Circuit City salespeople what they need and take their advice as gospel. For me, the Atari does the job and does it in a much nicer way. But, again, this is my personal choice :-).
Oh, one more thing. I still think for a beginning system there is nothing better than a 1 meg STe which can be had with bundles of software and monitor for a little over $300 US. So many families buy a $1000+ system for junior nowadays not realizing that there are other options available to them.

>2. What does your Atari do (or do more efficiently, elegantly, etc.)
>better than other platforms (particularly Windows or Mac)?

Just about everything. I have a 486/66 with all the bells & whistles
and I spend more time wrestling with it than doing things on it. On my
Falcon, I know what I want to do, and I can tell the computer to do it.
From telecomms to word processing to MIDI to rendering, there's no horrid
configurations, there's no "reinstall the system and ever application is
hosed" there's no "I'm a mac and I'll tell the user what to do and not
vice versa"

Yes, when my PC works, it's great... but in 8 years of ST ownership I've had
less hassle than I've had in 6 months (heck, in the first 2 weeks!) of
PC ownership. And I've used Macs in work situations. That's why, when I
dedicated my Falcon to MIDI, I got a PC to replace the normal duties.

>Please feel free to wax eloquent, and please mention for me what Atari
>model you are so attached to.

Any and all. I've had a 600xl, 800xl, 1040STf, 1040STE, megaSTE and currently
a Falcon.

>I'm not an Atari user, but would be quite interested in knowing what you
>find so appealing about your chosen platform.

It's a simple equation. I tell it what to do and it does it. A mac will
do something else instead and a PC will break 10 times first.

>Yess, but anyone who clones ATARI's must pay ATARI for a license!

Why..?

The Atari ST is a fairly simple design, composed mostly of off-the-shelf parts (it had to be, since Tramiel Technologies had to get the product to market in six months after losing the rights to the Amiga). It would be fairly simple to design an Atari ST "workalike" computer from similar parts.

The GEM desktop was licensed from Digital Research, who was bought by Novell... I doubt Novell has any further interest in selling licenses to use GEM (unfortunately it would have to be GEM 2), but you never know.

That leaves the underlying operating system (TOS) to be simulated... I doubt a compatible operating system would be difficult to create without using any Atari code.

The same applies to the TT and Falcon.. the question is, who would want to bother..?

(Yes, I know about the Medusa and the Eagle.. look at their prices, then look at their total sales..)

Thats why the ST failed.. Atari's marketing sucked... Apple's marketing research systems responded to customers needs. My Mac does not tell me what to do. My Mac suggests this particular extension belongs in this folder and I have the final say.

428. Atari 520ST problems

Newsgroup: comp.sys.atari.advocacy
Date: 1995-02-17 00:47:35 UTC
From: lreuter@mail1.sas.upenn.edu
Message-ID: <3i0rn7$c1a@netnews.upenn.edu>
Source record: 13679

A friend of mine was just given an old Atari 520ST. Everything went well, but he tried to copy a disk using an appartently faulty drive and now when he tries to use the source disk, he gets "TOS ERROR #35" when he tries to run a program on it (it is a music sequencer-type program from Hybrid). Does this mean the entire disk is bad (it still opens), or just that program, and is there a way to save it. You see, the operating system manual did not come with the gift (of course). Any help would be greatly appreciated. BTW, if anyone has an old user's manual for this computer (520ST), please let me know.

Thanks in advance.

-Leo

429. Time for some ADVOCACY.....

Newsgroup: comp.sys.atari.advocacy
Date: 1995-02-17 01:03:14 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <792982994snz@yeadontt.demon.co.uk>
Source record: 13680

I have been an Atari user since 1987. I started with an STFM with a single sided floppy, since then I have progressed through a Mega 4 ST with a Megafile 30 hard disk to a TT030 with 8Mb RAM and an internal 105Mb hard disk.

I have stayed with the Atari platform for one simple reason. I LIKE IT.

The Atari machines I have owned have always performed well and I have never experienced any major unreliabilities from either software or hardware.

I currently use my TT for small scale Desktop Publishing with Calamus SL, vector drawing with DA Vector and programming with GFA Basic 3.6TT and Devpac TT.

I have been involved in many debates with PC (contemptables?) owners over the last few years, and on each occasion stated my belief that the PC clones are just a 1981 design with go-faster stripes bolted on afterwards, with the inevitable incompatability problems that always go hand in hand with this type of system. I mean, who wants a operating system (Windows) that requires 8Mb of RAM to be useable and requires over 30Mb of hard drive space! I compare this to TOS which runs on a 512Kb machine from a 256Kb ROM and still leave enough memory for applications to run in.

I wish Atari would go back to devoloping computers, my current dream machine would be based around Jaguar hardware with the CD-ROM as standard. All Atari need to do is add a 'Desktop' enviroment to a Jaguar and put in a descent case (seperate keyboard essential). Imagine the processing power available for graphics and sound (Multimedia) work that this combination would give.

I have stuck by Atari for nearly eight years now, and can still see no reason for me to change this situation. I thought that the Atari computers were just about washed up until I joined the Internet, now I can see that I was wrong.

Long Live Atari Users!!!!!

Atari made IBM PC clones at one time; they stopped, long ago. Ever heard
of the Atari Business Computer (ABC)? No? Now you know why they stopped.

It would be an even _worse_ idea for Atari to get into the clone business
these days. There's no margin left in it.

>Just out of curiosity: what the hell _is_ in the 2 megs of ROM the Mac
>has? It surely can't be the OS, as it would be "inconvenient when it's
>time to upgrade".

The 2 megs of rom are system traps, little subroutines that
execute when called upon by the OS or programs. Around 128-256k of that
is the basic graphics and interface stuff. The rest is goodies like
networking, communications toolbox, performance enhancers for specific
modles, all kindsa fun stuff.
If you have an outmoded Mac with dinky ROMs, the OS will provide
patches. Not as convienient, to be sure, but it gets the job done.

Note: I am not taking sides. I own and love the Mac, but am
equally interested in other platforms, such as the ST/Falcon.

I don't think this is the case. More and ore people are switching
to once obscure platforms such as Sun and Silicon Graphics.
What consumers are looking for, IMO, is a stable, supported
platform that offers superior performance, even if it comes at a premium.
The trouble with Atari and Commodore's Amiga is simply that the
support behind these two wonderful platforms are basically the Banna
republics of the computer industry. They don't have software evangelists
out there kicking developers' butts to develop good ST applications, they
don't have a marketing campaign, and they don't do any hard-core computer
science R&D; they merely repackage whats out there already.
If Atari had made a deal with an obscure chip manufacturer with
an awesome microprocessor that could go toe to toe with the PowerMac or
Pentium, or even just the 68040 and 486, and if they advertised, and
invested money in publicity, we would be seeing a huge increase in the
customer/aftermarket base.
Unfortunately, due to bad management, another good platform is
relegated to obscurity.

God, I hope not! Instead of making little C-64 style computers,
they should start making handbooks. Yery simmilar to the Zeos Handbook.
Add in a PCMCIA type III slot, kittyhawk HD, built in modem and an
active-matrix backlit color screen. Then, bundle it with a cellular link,
and position it as a "Portable Internet Workstation".
Think about it, TOS is a Unix derivitave, right? And it has Unix
development tools, and networking stuff like TCP/IP, UUCP, Usenet, etc.
This makes a perfect, low-cost net surfing vehicle!

This, however, requires a competent management behind it, one
that can invest in the advertisement and industry evangelism neccesary to
make such an effort fly.
Atari is doomed. B)

Christopher Taylor Oates <aspect@cats.ucsc.edu> wrote:
>Uh... the mac does things like: I drag a file and IT decides whether I wanted
>to copy or move based on a (usually wrong) internal criteria

You mean just like the GEM Desktop assumes that when I drag a file that I want to copy it? The Mac's criteria are very simple. When you drag an item from one disk to another, it assumes you want to copy. All other times, it assumes you want to move the file. This is logical and fits in with what most people actually do in the real world.

You *do* know that it is very easy to tell the Mac that you want to copy a file instead of moving it? In fact, it's almost the same as on the Atari.
In GEM, you move a file by holding down control and dragging. In the Finder, you copy a file by holding down option and dragging. Alternatively, you can select the item and choose "Duplicate" from the File menu, or press Command-D.

> It tells me
>when I can and cannot eject a disk. Blah Blah...

The only time *I* ever use floppies is when I'm installing a new program or copying a document from a friend.

> Yes, the mac has a certain
>place for people who don't want to know about computers but use them anyway,

Are you telling me that I don't know (or don't want to know) about computers because I'm a Mac user?

Asking legitimate questions is a bit different from telling people you only want to hear one side of a story...

Your own answer was full of misinformation about other brands of computers than it was about positive experiences with Atari computers, which was what the original question asked about.

Just because you don't like a particular brand of computer doesn't make any other brand any better.

If you like your Atari computer, then say so.. you don't have to "put down" anything else to make the Atari appear better.

The question was NOT about what's so bad about IBMs and Macintoshes, or anything else... why answer it that way..?

>Too bad Atari didn't release the STBook here. It would have sold better
>then the 2/386(?)s they went with.

Umm.. no...

The STBook computer had NO floppy disk in it, or available for it. It had NO backlight on its screen, and it had NO means to attach an external monitor or keyboard to it. It had NO standard I/O ports on it.

What it DID have was a pricetag as high as other notebooks on the market that DID have these features. It would have fallen flat on its face, and Atari finally realized that, and pulled it.

The only x86 machines Atari ever made were desktop units under several different names, the last being "Atari Business Computers", or "ABC"..

The one portable PC clone Atari did make was the Portfolio palmtop, but that was in a different class from the notebook market.

The biggest problem with the Atari PC clones, besides their typical marketing, was the time it took them to get the machines to market. By the time they got their 8088 machine ready to sell, AT class '286 machines were common and were sellling for much the same price as the Atari 8088s were. Then when they got their '286 ready to go finally, the '386 was the industry standard..

Much like bringing out a 16 Mhz 68030 machine just in time for the market to have moved on to 25 Mhz 68040s...

The computers were never BAD designs, they were just too late...

There is no Pentium SX. Never was and never will be. The only chips that had the SX suffix were the 386SX and the 486SX. The 386SX was a 386 with a 16-bit external interface rather than a 32-bit one. The 486SX (which was a joke) was a 486 with a crippled floating-point unit (kind of like the Pentium's ;-)). If you added a "487" math coprocessor (which was really a regular 486) to a 487-based system, the system bypassed the 486SX and used the 487 (486) instead.

However, I read that one of the Pentium-chip cloners (forget which one) was going to release an FPU-less Pentium clone. There rational for doing this was that it would keep costs down and most users don't really need an FPU anyway. Is that the chip you were referring to??

>the original question asked about.

Misinformation? Yyou mean I lied? Yeah right...

>Just because you don't like a particular brand of computer doesn't make any
>other brand any better.

I like Atari computers because I think they are better than Macs or PCs, and I
have the experiences to back up my opinion. If you are insecure enough about
YOUR choice of computer so that you cannot handle that someone not liking them,
that's your psychological issue.

>If you like your Atari computer, then say so.. you don't have to "put down"
>anything else to make the Atari appear better.

I'm not "putting down" anything. I state my opinions. I'm typing this on a PC
right now. It's my main computer. My falcon works better, but it's been
dedicated to MIDI. I've had nothing but headaches since I put this PC
together (yes, I bought the parts and assembled it, so I do know what is going
on in side it)

>The question was NOT about what's so bad about IBMs and Macintoshes, or
>anything else... why answer it that way..?

Okay. What is good about Atari computers is that they work the way you
expect them to. I cannot speak for any and all other brands of computers
that in my experience may or may not have operated in a different fashion.
Is that watered-down enough for you??????

First of all, this is not meant as an attack on the Atari platfrom but I just had to comment on the advisability of getting an Atari for your children. It seems to me that there is not enough support for the Atari to make that a good decision. Most young people aren't interested in looking for software; they want to run the program that they say at school and they want to produce files that are readily moved to their school computer systems. The Atari is also short of multi-media educational packages and tutorials. And for those who want to encourage their children to more than use their computer as a tool then the Mac and PC are probably better choises because they have cheap and user friendly developement environments and lots of documentation.

I like my FALCON 030 because it is a fine computer that does everthing I need it to, including Direct to disk recording and digital audio effects processing. I have ample software to do any of the work I need a computer to do including great wordprocessing with Bitstream Fonts and communications software, I'm logged in with my Falcon right now. It has nice graphics excellent CD quality sound, all the necessary ports and hardware for all I need to do and it cost me $1100 including a CTX 14" VGA monitor. (Purchased Used)
I would like to have more games and more selection in the software world, but I chose a computer which is not well marketed and not well supported.
I have received lots of help from other ATARI users in finding sources and there is probably a lot more available for my falcon than I know about.
The Falcon is contained All-in-one with really nice hardware for the price and it's all in one unit, which I like. Others may prefer a big separate box, but I like the small machine on my desk, it's about 19 1/2" along the front and about 14" along the side and and 3" tall including the keyboard and the HD floppy and a 65 meg HD.
Yes, the Falcon has character and the ATARI name is one I use with pride. Mine is a very personal computer, and it can do pretty much anything. I have tons of MAC and PC experience and I have encountered a lot of pleasing features and nice hardware, but my falcon is the machine for me.
Inside my falcon I have a tiny card which is made by a 3rd party called COMPO software. It contains a 286 and some BIOS rom chips, coupled with some COMPO software it sold with, it allows me to switch to a 286 mode and is fast enough in it's emulation to run windows in 256 color VGA and DOS applications (in 256 color 320 x 200 or mono VGA). It allows me to play a few games or run a few programs that I need for work or school.

Because my Falcon has a built in SCSI II port, I was able to add a syquest 270 removeable Hard disk unit. It gives me plenty of extra room and only cost about $500.00 US.

>If you could get a straight answer. Don Thomas would be the guy
>to ask. Everyone else will give you the run around.

No kidding..! One CompuServe Atari Forum member reported not long ago
that he called Atari Headquarters in Sunnyvale, California with a question
about his Atari computer... the people who answered the phone didn't even
KNOW Atari made computers..!

After shuffling him around to several different similarly clueless people,
they suggested he buy an IBM compatible computer. He hung up in disgust...

>I'm typing this on a PC right now. It's my main computer.
..
>I've had nothing but headaches since I put this PC together (yes, I bought
the parts and assembled it, so I do know what is going on inside it)

Well, I'm typing this on a PC that I assembled from parts myself, and it's
been nothing but a joy to use... it performs flawlessly in heavy day to day
use, runs orders of magnitude faster than my 1040STe, plays DOOM as smooth
as silk (which isn't even available on any Atari computer) and best of all,
has a future...

(Maybe you should ask someone for help that knows about PCs.. no system
should "crash 10 times a day" or whatever it was you said in your "non-
misinformation" opinion about PCs.)

>If you are insecure enough about YOUR choice of computer so that you cannot
>handle that someone not liking them, that's your psychological issue.

You mean my choice of Atari 520ST and Atari 1040STe..?
(Not to mention the 400/800/800XL)

Funny how the Atari supporters' arguments usually end up being personal attacks
when they run out of logical and factual arguments to hold up their end of
the "discussion"...

>Okay. What is good about Atari computers is that they work the way you
>expect them to.

Yes.. that was what the original question asked.

It wasn't about what's wrong with PCs or Macs, it asked what you like about
your Atari.

>Is that watered-down enough for you??????

No, that's what was asked for in the first place.

The PC Clone market is saturated with suppliers. There's no way
that Atari could move into this industry and compete. There seems to be
a multi-tiered arrangement of PC suppliers, in a market designed to
capture varying degrees of consumer thrift.

There's the old IBM and Compaq camps, mucho $$$. There's the
big-time mail orders like Gateway, Zeos, and Dell (and others). There's
the many many many numerous Gateway/Zeos/Dell wanna-bees....(majority of
Computer Shopper) selling generic Far East components (usually systems
comprised of whatever X brands of X components were available cheapest at
the time), there's the mass-marketers like Packard Bell (IBM, Dell, too).

Where would Atari fit in? They couldn't offer the support of
IBM, Compaq, Dell. They couldn't undercut the cheapest Asian clones....

Since the Power PC is still in its infancy, I'd very much like to
see an Atari Power PC. Here, they'd have a chance to incorporate a
little of that innovation that has always made Atari products unique, and
desiriable. Atari hardware has always sold largely on innovation (Atari
800 vs. Apple II, etc).

I think the Power PC is the way to go in the future. Power Macs
are actually pretty nice machines. Who knows what IBM will do with its
PPC machine, but there are LOTS of makers slating production of PPC
boxes. I'll bet if Atari had a design, they would be able to tap a lot
of Atari loyalists. Everyone who uses an ST/TT/Falcon would upgrade.
There are a lot of DOS users who would make the swap. I'll bet the
majority of Atari 8-bit and ST users who no longer use Atari machines use
DOS machines. When the time comes to upgrade, I'm sure that many of them
would be pleased to buy another Atari, if it offered performance/value as
other Ataris did in their heydays.

Atari "loyalism" is perhaps one of the strongest that *ANY*
market has ever known. If Atari had any ability and resources (they'd
have the latter if they'd have had the former), they would realize this,
and tap it. Most former Atari owners (that I have observed) smile in
favorable recollection when they see my 800XL system still in use. I'm
sure Atari could regain these past customers, if their product was hot
and their advertising widespread. Forgive me....I'm dreaming. If the
PowerMac only had a Fuji symbol, instead of that ghastly discolored fruit!

I use the Atari computer because it's the most FUN of any computer I've ever used. Since I obtained my first Atari computer as a child, I wondered how it works, and how to program it. I still haven't figured it all out, but I have a lot of fun doing hobbiest flunky programming (still learning...not much time) and answering those questions that I've had for so many years.

I cannot analyze my Atari in terms of a new computer, because they are birds of a different feather. See those old Model-T cars all restored? Their owners seem to take great pride in them; many do all the restoration themselves. One guy I know can took a 1940 Ford pickup out of the ditch (upside down, rust holes and bullet holes) and made it into a show winner (all original). Must it be compared to a 1995 model to be appreciated? I think not.

The Atari 8-bit was so advanced for its time, that I am still pleased to this day. Every once in a while, an Eastern European demo comes up with so many colors and moving objects that I grin for some time. I've walked into the software store MANY times, with cash-in-hand, looking for a game to play on the PC. Most times, I leave with my money in my pocket. Besides flight simulators, I don't enjoy modern games as well as the old school. The Microsoft Arcade was perhaps my favorite PC game. Why do I need to buy these all over again? I'll just play 'em on my Atari.

I believe it was only the initial batch of 486sx chips that were really
crippled 486DXs. Ironically, the initial 486sx were probably MORE
expensive to produce thatn the 486DXs!

The company that produces the FPUless Pentium clone is called NexGen,
I think. The chip is not a direct replacement for a Pentium, it
has to have its own motherboard.

Here it comes. As Apple embarks on their second generation PowerMacs, the Falcon as we know remains the faithful trying to compete against the odds.

Atari= The falcon will never be updated but the Macs will..

* May 31, 1995

PowerMac 9400/120 [Tsunami]
- New "fat tower" case
- 604 @ 120Mhz [this could be as high as 150Mhz]
- 6 PCI slots
- $5,400 (retail, not street)

* July 31, 1995

All 68K desktop machines and NuBus PPC machines discontinued.

PowerMac 5300/75
- Redesigned 575-style machine
- Looks like a Multiple Scan 15 with a little extra trim on the
- bottom to accommodate a mother board, floppy slot, etc. This is the first 603+ machine and will be available at first for K-12 only.
#30 16-FEB-1995 11:20:55.14
MAIL
- 603 @ 75Mhz
- IDE internal hard drive
- 1 PCI slot
- not upgradeable to other processors
- $1,500

PowerMac 6300/75
- 630 case
- 603 @ 75Mhz (could be a 601 in here)
- IDE internal hard drive
- 1 PCI slot
- not upgradeable to other processors
- $1,200

PowerMac 7150/80 [TNT]
- New-style cross 630/7100 case
- 601 @ 80Mhz [this oo-PCI
- $3,000

I agree, However Apple felt that their products were worth the premium because of the Marketing and system support. Apple could not help it that Atari and C= lacked confidence in their products. I wondering why Apple outsold C= and Atari despite the higher price..

BobR (76702.1466@CompuServe.COM) wrote:
: >Yess, but anyone who clones ATARI's must pay ATARI for a license!

: Why..?

: The Atari ST is a fairly simple design, composed mostly of off-the-shelf
: parts (it had to be, since Tramiel Technologies had to get the product
: to market in six months after losing the rights to the Amiga). It would
: be fairly simple to design an Atari ST "workalike" computer from similar
: parts.

Yup... it was simple. But it worked. If only they UPDATED it
with 020's 030's, better video, etc... they would have held on to a lot
of users that they lost...

: The GEM desktop was licensed from Digital Research, who was bought by
: Novell... I doubt Novell has any further interest in selling licenses to
: use GEM (unfortunately it would have to be GEM 2), but you never know.

Bleh... Digital Research shot themselves in the foot, if not other
places when they caved in (IMHO) to Apple's lawyers. They were SO CLOSE
to the Macintosh... we might be using GEM instead of Windows right now if
they had stuck to their grounds (or gone Chapter 7 from the legal fees, but
that's better than winding up on Novell's shelf...)

However, Novell would probably SELL Gem outright if anyone gave
them a decent offer... they proably won't be using it again soon.

: That leaves the underlying operating system (TOS) to be simulated... I doubt
: a compatible operating system would be difficult to create without using any
: Atari code.

Guess what... it's CPM/68K! :) Novell would probably turn it over
outright again, probably quicker than GEM :)

Now, if I wanted to design a non-ibm computer, I'd build a 486DX2(4?)
box with special hardware, and add Linux drivers which make the system much
more powerful than ANY other 486 Linux box... maybe to the point of
outrunning Pentiums...

(I'm being serious - there's a lot one can do outside the ISA
/VLB setups... even tuned, IDE transfers soak up 30% of CPU, and they're
usually 50%. Better I/O would make a better Linux box...)

- Chad Page

: The same applies to the TT and Falcon.. the question is, who would want
: to bother..?

: (Yes, I know about the Medusa and the Eagle.. look at their prices, then look
: at their total sales..)

Special Reserve have them at this price (have a look in ST Format for their ad) - but since Rumbelows are being closed down you could try there.

: Who's bashing?

You are.

: What upgrade? Costly?

Medusa and other TOS Liscence machines. In addition, there are
lots of expansion boards for the Falcon.

: I agree, However Apple felt that their products were worth the premium because
: of the Marketing and system support. Apple could not help it that Atari and C=
: lacked confidence in their products. I wondering why Apple outsold C= and
: Atari despite the higher price..

The only did so in North America. The ST and the Amiga clobbered
the Mac in the European Marketplace.

I highly doubt C= and Atari lacked confidence in their products.
They didn't want to gouge customers the way Apple did. Regarding the
premium price bit, Apple was waaaayyyy too premium. I can distinctly
remember (in Canada) a few years ago:

Mac 512 Atari 520 ST
- 68000 - 68000
- 512K - 512K
- 2 colours - 512 colours
- 7.8 mhz - 8 mhz
- no built in MIDI port - built in MIDI port
- point & click interface - point & click interface
- 580 * 340 res - 640 * 400 res.

Price:

- $2000! - $500

A little too extreme of a difference don't you think?

Does anyone has Star Raiders I for the old
ATARI 8-bit computers gathering dust?

I am willing to buy it (of course, must be
in working condition :-)).

If anyone knows where I can get it, let me
know.

Yes, Apple charged a premium to fund a marketing campagn and R&D. The prices charged by Atari and C= barely managed to cover expenses despite the lack of funding for R&D. Apple felt at the time that the market would support a premium and that was the case for awhile..

I have used PC's, unix boxes and now own a Falcon. Now lets be
honest, yes it is:
easy to use
a true plug in and go system
quite fast

What is doesn't offer now is true "Power without price". If does
however offer an excellent range of good cheap software ranging from
PD to Full commercial products. Also, you can get away with running
Applications on a 4 meg machine (what I have) and still have space to
multitask (you can on windows but its a bit dodgy).

The current Falcon simple doesn't cut any ice and the current price,
now say Atari bundled it with a cheap SVGA and Works (with an
imporved LOOKING GUI) and sold it at the same price. They'd shift
a few then.

Here's a little jingle that all atoyi losers should be intimately
familiar with:

(sung to the tune of Jack 'n Jill)

The Atoyian sees a fuji
And gets a giant boner
He rubs his balls
And strokes his schlong
His jism flows soon after!

(to make the jingle a little more personal you can replace the 'Atoyian'
and 'fuji' with the name of your favorite Atoyi loser and the loser's
specific choice of the Atoyi product line that fuels his fetish!)

%
% Umm.. no.. Atari TOS was originally based on CP/M 68K...
%
% People have developed UNIXlike tools to use with it, true.
%
% BobR

Semantics.

The OS *is* a unix-like OS. It is now derived from Unix - it was not
originally derived from Unix. The OS is no longer `TOS', it is either
MiNT or MultiTOS (same thing). Since you can take unix source and
compile it without change, I think it's fair to say that the OS is
a unix-derivative.

Granted the original poster said `TOS', hence my first paragraph.

Simon.

```
: Yup... it was simple. But it worked. If only they UPDATED it
: with 020's 030's, better video, etc... they would have held on to a lot
: of users that they lost...

You are exxagerating a little. The Mega ST series used 68020
processors and the Falcon and TT used 030 processors. The STe, the TT and
the Falcon all had better video than the ST. Atari also updated TOS,
sound chips and other features. They didn't just "STOP" with the ST design.

: Guess what... it's CPM/68K! :) Novell would probably turn it over
: outright again, probably quicker than GEM :)

TOS is an Atari product, not a Novell/Digital product. Atari owns
the copywrite.

Message-ID: <3ibii3$4ve$1@mhade.production.compuserve.com>
Source record: 13629

Er.. umm.. the STe is almost *exactly* the same as previous ST designs.

The MegaSte used a "clock doubled" 68000, not a 68020.. no ST ever used anything more advanced than the 68000.

The STe has a slightly wider choice of colors in its pallette, but otherwise its video is exactly the same as the earlier STs.

All models of the ST used the same sound chip. The STe added the ability to play DMA sound directly out of memory as an alternative to the sound chip.

Essentially Atari added tail fins, a little more chrome and a slightly hopped-up engine to the same design they came up with in 1985 and tried to sell it as the "All New 19xx Model" for years.

The TT was an interesting kludge of standard ST technology with a 68030 grafted on, and the Falcon brought a 68030 to market just as the 68040 was becoming the industry standard among competing products.

Make no mistake, the original ST design was revolutionary in its time. It was just never brought into today as it should have been.

That's because this is comp.sys.atari.advocacy where flame wars live...

Since there's no Falcon dedicated newsgroup, general questions and discussions
of Falcons and their use in producing music should probably go into

comp.sys.atari.st

Where there shouldn't be any, or at least many, flame wars...

Actually, the Commodore 64 was the *BEST SELLING HOME COMPUTER IN THE WORLD*.
outselling the Apple II, the Atari Home Computers, the Radio Shack models,
you name it...

And, the ironic thing about this is that Commodore, at the time when this
arguably inferior 8bit computer was being marketed more effectively than any
other home system (including the technically superior Atari 800), was being
run by none other than Jack Tramiel, the person who now owns Atari Corp.

What's wrong with this picture...??

BobR

483. Re: What will Atari do if the Jag fails??

That's a rather interesting piece of logic, I must say..!

TOS is "now" derived from UNIX, even though it was based on CP/M 68K when it was originally written..?

I think 90% of the owners of Atari computers would be pretty surprised to find that the OS in their computers was suddenly NOT TOS, but was instead "MiNT or MultiTOS"...

As far as I'm aware, the number of people using MiNT or MultiTOS is vanishingly small. The computers still come with TOS installed, which sort of seems to me like it's the "OS"...

At any rate, the point is that TOS was NOT derived from UNIX, no matter what anyone's "semantics" might say.

BobR

484. WAVEFORM EDITOR FOR MIRAGE SAMPLER WANTED!

Source record: 13635

: The MegaSte used a "clock doubled" 68000, not a 68020.. no ST ever used anything
: more advanced than the 68000.

Wrong. I have several magazine articles which state that the Mega
ST used a 68020. I'll dig them up for you.

: The STe has a slightly wider choice of colors in its pallette, but otherwise
: its video is exactly the same as the earlier STs.

Four times larger, to be exact. Not slightly. The resolution was
the same, but the improved pallete was an improvement.

: All models of the ST used the same sound chip. The STe added the ability to
: play DMA sound directly out of memory as an alternative to the sound chip.

And it was in stereo. More improvements.

: The TT was an interesting kludge of standard ST technology with a 68030 grafted

The TT was fast (for it's time), had vastly improved video as
well as some other interesting features like UNIX compatability.

: on, and the Falcon brought a 68030 to market just as the 68040 was becoming the
: industry standard among competing products.

I agree here.

I have used PC clones (which have a simple disk eject button) for seven
years, and I have yet to screw up a FAT or damage a file. Why do Mac
users always assume that people who use other machines are incompetent
when it comes to computers? Any semi-competent user can handle a floppy
disk. And if anyone is stupid enough to eject a disk that is being written
to, that's their problem! They should have known better.

>Pretty poor argument, if you ask me...

It's only a poor argument if you assume all computer users are incompetent.

Loyalty - a scarse comodity in the world today.

>1. Why do you like your Atari computer?

It's like a comfortable slipper, well worn & you know what it's going
to do. But, also, it is an elegant & useful system. The display is lovely.
The enviroment (desktop), at least on my falcon, can eat Windows for lunch
in terms of speed & useability. Using GEM 4.x on a 32Mhz 68030 is so much
faster than windows on a 486DX2/66 you would not believe it.

>2. What does your Atari do (or do more efficiently, elegantly, etc.)
>better than other platforms (particularly Windows or Mac)?

Well, I use my f030 mostly for electronics design work & comms. It provides
me with all I need to produce reports & documentation as well as designs.
All my ECAD programs integrate well, so I have a simple design, simulation
& synthesis solution for less than the cost of just the software on other
platforms. Also, all my CAD programs produce GEM files which allow me to
integrate with my documentation programs.

And when I feel the need to get into the internet, thats cool as well,
X windows & BSD networking are there when I need them & give perfectly
acceptable performance. I can be a bit of a Unix head, so MiNT gives me
simple Unix & X. If I feel the need to be totally unixy I can use
Linux68K, which is every bit as good as the PC version. When I'm running
X, you couldn't tell whether I was using an X workstation or my falcon.

Of course, GEM is perfectly good for single tasking stuff....single tasking?
But what about accessories....most of my programs bring up hypertext help
from the ST-Guide accessory, which is multitasked with the main program.

MultiTOS is a dog, and I won't try to defend it. If I had written such a
piece of shite I'd be embaressed to give it away, never mind sell it, but
thats ok - I don't need it.

Don't mail me, I don't care if you agree or disagreee. I don't have my head
in the sand. I'm typing this on an HPapollo700, so I know what a powerful
machine is. But I like my f030. I've spent 2 years moulding it around the way
I work, and I've not seen anything which tempted me to move to another platform.
Linux almost made me buy a PC, but Linux is availalble for my falcon now, so
I don't need to.....

All of the above are my opinions. Read 'em & weep.

Craig.
(Owner, user, programmer of ST series machines since 1985. And happy...).

Why put covers over the 110 volt power supplies in computers then..?

Any semi-competent computer user will know enough not to stick their fingers in the juice, right..? They'll never accidentally put their hand in the wrong place and will never get zapped, right..?

With write-back caches especially, but with just "human nature" it's likely the "average" user may just unthinkingly pop a disk out of the drive before it's done being updated (maybe you're an above average computer user if you've never done it).

Why not have the computer protect the user from accidents with disks the same way they're protected from accidental shock..?

The point is, it's STUPID to demand to be able to pop the disk at any time you want to... the only time the computer WON'T give it back is when it's writing to it... when it's done updating, it ejects the disk.

The same as the "semi-competent computer user" would do...

>Wrong. I have several magazine articles which state that the Mega
>ST used a 68020. I'll dig them up for you.

I'll be interested in seeing what those articles have to say...

I'll be waiting for another apology, by the way. ("Wrong" is a pretty
strong statement from someone who appears not to have any actual
experience with the computers in question. You really shouldn't rely
so much on what "magazines" say.)

You can, of course, always verify it with someone at Atari Corp...

>Four times larger, to be exact. Not slightly.

True, 4096 color choices is four times larger than the original 256.
However it's only a slight improvement when considered on a scale of
zero to 16.2 million, which is what the rest of the world is using.

(Even on a scale of zero to 65 thousand, which is probably closer to what
was available at the time the STe was introduced).

The point is, all of the ST models were only very slight incremental
improvements over previous models. Certainly nothing on the same scale
as moving from CGA to EGA, or from 360K floppies to 1.2 Megabyte floppies.

For whatever reason, Atari never put much effort or money into improving
the original design of the ST. Just after the Mega ST was released,
Neil Harris of Atari told me that Atari was only putting about 3% of its
resources into R&D, which sounded scary at the time, and which in the light
of actual results sounds about right.

(By the way, you missed the hardware scrolling on the STe.. that was another
of its "improvements"... :)

Atari would be better off getting the Jaguar some *software*, and the
CD-ROM drive, ASAP.

Bringing out another computer product would be a waste of time and a
waste of resources (something they cannot deal with right now, even with
Sega's extra cash).

They _should've_ released an '040 system when the Falcon was released,
not a crippled 16Mhz '030 system (with a 16-bit CPU-RAM datapath and
grotesque amounts of system-bus contention thanks to the video system).
Hell, even the MegaSTe was a waste of time (oh joy, a 16Mhz 68000 system
when they've already got an overpriced 33Mhz '030 system). The TT is a
fine system, but it's EXPENSIVE... current prices seem to be about as
much as a 66Mhz PowerPC-based Mac or 60Mhz Pentium-based PC system!

BobR,
You don't think that you're generalizing too much by accusing Atari users of nearly always resorting to personal attacks, do you? Geez. My post did not pick apart Macs or PCs. Besides, to tell others what is good about one's own system, it is easy to compare it to to another system. Furthermore, I have never seen an Atari user posting flames about another platform in another newsgroup. I guess this means that Atari users are much more mature than users of other systems, right?!
I, personally, get sick of wading through senseless flame after flame. I thought it was nice to have someone want positive advocacy for once. It is a shame you see this as "misinformation." I forgot that every Atarian was too blinded by product loyalty to be objective. Isn't it strange how users of other platforms always tell Atari users the "truth" since we cannot see the light? :-)

Consistency is the hobgoblin of small minds. It is impossible to be totally
consistent. As I said: it is logical and conforms to most people's
expectations.

>Tell me: how do you force a MOVE between disks? Answer: you cannot on a
>mac.

You can't force a move between disks. Yes, this could be considered
a shortcoming, but I don't move files between disks that often. I can think
of things that TOS does that are much worse that this.

No, you're wrong. The Mega ST used a 68000. The Mega STe used a 16MHz 68000.
(Everything else on the motherboard ran at 8MHz, except for the processor,
which ran at 16MHz. A cache improved the performance significantly.)

> Four times larger, to be exact. Not slightly. The resolution was
>the same, but the improved pallete was an improvement.

From 512 colours to 4096. (There were 16 shades of each colour instead of 8
as there had previously been.)

> The TT was fast (for it's time), had vastly improved video as
>well as some other interesting features like UNIX compatability.

The TT's video was adequate; it was slightly better than standard VGA. The
only impressive thing about the video was the 1280x960 mode. UNIX was never
released for the TT.

The STe came out in 1990. At the time, VGA machines with 640x480x256 out of
256000 were common. The STe's video in 1990 was still 320x200x16/4096 and
640x200x4/4096.

>On which machines?

16 bit High Color has been available on PCs since the STe was introduced..
it may not have been widely used at first, but it was available, and was a
far greater improvement than the slight move from 256 to 4096 colors on the
Atari platform.

Before you respond that few applications used High Color at the time, the same
is true of the extended color pallette on the STe. In fact, few applications
use it today, while True Color (16.2 million color) applications are common
on the PC platform.

Regarding Atari '386 notebook computers, we just had a Canadian CIS member
asking where to obtain a memory expansion for his, so indeed I was wrong
about their never having released anything like this... it's just another
good example of how well Atari has managed to keep their products a well
kept secret.

(An Atari rep from Atari Benelux had to tell him they never made the 4 Meg
upgrades, but he can get a 1 Meg expansion from them in Europe.)

Again, it's not the usefulnes of any one ST feature that's the problem, it's
that there was never any coherent program of advancement applied to the product
line. Most of the new models were just old models repackaged in different
cases and with a little more "chrome".

>You don't think you're generalizing too much by...

Not really... while there have been some very good responses about what's good about Atari computers, there have also been an awful lot that have tried to make their choice of Atari look better by characterizing the other platforms as "crappy" and otherwise incompetent.

What's good about my Atari computers is NOT that PCs crash 10 times a day, or Macintoshes won't give you your disk whenever you want to pop it out.

What's good about my Atari computers is their compactness, and the "look and feel" of using them... and my other computers have their own features and plusses.. none of which take away from the Atari machines.

I don't like PDP-11 computers personally, but that doesn't make them "crappy" or the people who use them somehow sub-human.. (not that there are all that many PDP-11s still being used).

The problem with making comparisons between brands is that much of the time those comparisons are completely subjective, and often lead to the kind of comments we've seen here. Everyone is of course entitled to their own opinion, but the problem I originally had with this thread was that it was specifically set up to be completely one-sided.

I do it all the time. I keep an organized hierarchy of files. New items downloaded to go a downloads directory then are moved to the appropriate partition if I decide to keep it (applications, files, OS stuff) This is a regular and heavy use of this feature on my system. In fact, I tend to move between partitions more often than I copy between them. Just goes to show that every one uses computers differently, and the way the Mac works does not conform to my computer use. Hence, I will never own one.

>I bet your Mac has never crashed either???

Surprise... I don't have a Mac.

The closest I've had is the Mac emulator on my Atari ST...

And you STILL had to be careful not to pop the disk manually when ejecting the disk until it was done updating.

(You would have loved it.. you could have trashed floppys to your heart's content...)

I have seen obscurity, and its name is ATW.

(of course it's possible that Matthew was thinking of the ARM, which would be another story. Since ARMs consume little power, it might be possible to do one as a cartridge port dongle.)

Um I think Bob may know what he's talking about. Actually my Mega ST has a 3rd-party CPU (ADspeed, 16 MHz 68000), but the previous owner never said anything about removing a 68020 to put that in :).

People have been known to use 68010s in ST[e]s in order to get more MIPS (or KIPS ;>) at the same clock-rate, but the only CPUs Atari ever used in the ST range were 68000s; 8 MHZ for all except the Mega STe, which was 16 MHz. TT and Falcon are 68030 (32 MHz and 16 MHz respectively), and that's it SFAIK.

Face it, Atari DON'T make computers any more and aren't likely to
do so in the near future. The Falcon is DEAD and buried. The ST is gone.

Atari are now a videogame manufacturer, their only product is the Jaguar
and lets face it, they've hardly made a great success of it.

Same old Atari as ever, I'm afraid.....

Sorry, but that's not true. Mega ST only differed from ordinary ST in
the casing, the BLiTTER and TOS 1.2 as opposed to 1.0. And the MEGA
bus, of course. That's all.

>: The STe has a slightly wider choice of colors in its pallette, but otherwise

Resolution should've been 640x400x16 at least. That would have made a
difference. As a matter of fact, 4096/512 = 8, not 4. So even more
`improvement'!

>: The TT was an interesting kludge of standard ST technology with a 68030 grafted

|> The point is, all of the ST models were only very slight incremental
|> improvements over previous models. Certainly nothing on the same scale
|> as moving from CGA to EGA, or from 360K floppies to 1.2 Megabyte floppies.

But Ataris later machines were more than just a slight increment...

The TT, as a machine aimed at business machine was a hugh improvement over
the Mega ST.

The Falcon was a huge improvement as a "home computer" over the STe...

|> For whatever reason, Atari never put much effort or money into improving

|> resources into R&D, which sounded scary at the time, and which in the light
|> of actual results sounds about right.

Such a shame, as the ST and later machines would have been much more successful
if there had been a continueing support.....

Even now, what has been done in R&D is not being used - take the non-release of TOS 5 (4.92 beta has been around for a while..)

|> (By the way, you missed the hardware scrolling on the STe.. that was another

Mark,

As an owner of a Mega ST4, I can assure you that it uses a plain old
8Mhz 68000. The main difference between the Mega ST and the original
ST was the inclusion of a BLiTTER chip and an internal expansion slot.

Other than that, it was pretty much like a standard ST. In my
opinion, this was the main reason why the ST never really became
successful. The competition kept improving while the ST/TT/Falcon
basically stood still.

I will never understand why Atari didn't increase the memory capacity
of the ST line starting with the Mega ST (it wasn't until the TT030
when you could have an ST with more than 4 megs). Especially when you
consider that the SLM804 laser printer consumes about 1 to 2 megs of
your computer's memory just to print out something!

Atari also took way too long to improve the ST's graphics and sound
capabilities. Many people bought STs because of it's superior
graphics and sound capabilities and when the competition surpassed
them, it became difficult to justify buying an ST/TT/Falcon.

Finally, most of Atari's later designs were not as fast as most people
expected or wanted. If only they could have released a 68040 based
Falcon to go along with the Falcon030....

> 1. Why do you like your Atari computer?
> 2. What does your Atari do (or do more efficiently, elegantly, etc.)
> better than other platforms (particularly Windows or Mac)?

I think that all this "my computer is better than yours" is a load of old crap. Nobody will change anybody's mind and all this ranting backwards & forwards is getting nobody anywhere.

I have owned a multitude of computers from the ZX range, Sharp, TRS80, Amstrad, Atari, Acorn, Commodore, IBM, and have used machines from Altairs to Crays. with operating systems that have run from CPM,VMS,UNIX, various command lines to windows to full GUI's.

Each machine had its good and bad points.

Ignoring all the 8-bit machines (old hat, but fun) I have yet to find a machine that fills my criteria as a brilliant machine.

The problem with trying to compare computers is that people can't seem to separate hardware, OS-systems, applications and programming.

Atari computers have so far given me the best in the 16/32 bit region for OS-System and programming but the PC blows the Atari away with applications.

Apple Macs though fairly compact and well thought out are not designed for flexibility for the user, but more for flexibility of the application.

I treat Atari & Apple Mac together as they are extremely similar in both chip architecture and GUI. but there the similarity ends as the Atari is way ahead of the Apple in terms of ease of programming.

How many Mac users program their machines to the depth that the ST, TT or Falcon are programmed ? This is not due to the lack of decent software that some people will surely cite, but just that you can and so easily.

Every Atari user can program in some fashion - Basic, C, Pascal, Scheme, Ada, Forth, Lisp, Prolog, Assembler. Everyone does but why not on the Mac ? Some may dispute this but just look at the PD libraries for proof.

I personally believe that this is down to the slot in the market that the manufacturer pegs their computer to. The Ataris were marketed to the home & hobbyist user, whereas the Mac is hyped as the Ultimate Application Driver.

Neither has achieved what it set out to do.

Apple's failure is due to their greed. The machine was originally limited with only a couple of applications that shone. The price of a useable machine was out of most people's range. It ended up as the 'Power Users' machine

carrying out specific tasks such as DTP work.

Atari's failure was (as always) marketing. Each machine thay have issued was always way ahead of the competition in ease of use and power for the price. But they never really pushed the machine, and they would market an update without really thinking it through.

Each company has improved and updated their computers and both have made the same basic mistakes. If the computer is compatible with a lower model then there is rarely any incentive for the software writers to write specifically for the update. If the update has no software, who will buy it ? The vicious circle turns.

When you get to the PC you hit a worse problem. The machine was developed as a business system. As we all know business is very pragmatic in its view of technology and so a machine that could run the software they wanted didn't need updating, and so you end up with a computer years behind the home market. eg. the PC world is in a storm over Windows, a system that has been fitted to home computers for 10 years.

Only when the games and hobbyist systems stagnated due to not having a new platform did they move to the next most powerful machine available which unfortunately was the PC.

The lack of decent hardware & OS-system was a temporary problem, only partly cured by extremely poor hardware & Dos updates. There is no memory management unit in a PC and therefore all memory management is carried out by a software patch. This is extremely inefficient and left the programmers with no choice but to demand an increase in power and facilities. 286 -> 386 -> 486 -> 586; Hercules -> CGA -> EGA -> VGA -> SVGA. With the increase in hardware modifications and the infinate variety of cards available the programs had to get bigger to cope. If any of you have tried to program the PC you'll know what I mean. Bigger programs are harder to write in Assembler or low level languages so you end up with compiled high level code - more inefficiency so more power is needed.

As updates increase in cost & frequency more of the kids can't play games and the consoles fill the gap. Now we have a generation of users who don't even know how to program (apart from " Insert Cartridge/CD & switch on").

Where will it all end ?

A home computer with more power than Nasa to play an arcade game ?

A console that you do your accounts on ?

A business computer that can do a year's accounting in one millionth of a second (but not correctly if it's a Pentium) ?

Who knows?

But my dream machine is the Cray's power with Jaguar's sound, full virtuallity systems for graphics which can run software from any other machine, a full chip (not software) multitasking GUI similar to GEM & System-7. I

would want it to have the programming docs written by Amstrad (the best I've ever seen), all the applications you could dream of in ROM (and Microsoft personnel against the wall when the revolution comes).

I see your point Bob, but this analogy isn't perfect. First of all, no one was ever eletrocuted by a floppy disk. The worst you could do by ejecting a floppy at the wrong time is ruin all the data on the disk - which is hardly life-threatening, especially if you remember to back everything up. Secondly, a user never has to do anything with the power supply (except possibly repair it), while a user frequently has to do something with their floppy disks. This means that while it makes no sense to make it easy to get at the power supply, it does make sense to make it easy to get at the floppy disk.

>With write-back caches especially, but with just "human nature" it's
>likely the "average" user may just unthinkingly pop a disk out of the
>drive before it's done being updated (maybe you're an above average
>computer user if you've never done it).

True. You can never forget Murphy's Law. A user might do something stupid like not wait for the disk drive light to go off and the drive to stop whirring and remove a disk that is being written to.

Of course, a user also might accidently put the disk to close to monitor and erase it. Apple should their monitors in clear, inch-thick, radiation-proof cases to prevent this from possibly occurring. Oh yeah...it is also true that a user may leave a disk in their shirt pocket and wash the shirt. Waterproof floppies should be introduced. Or a user may lose a disk and not be able to find it. How about a floppy disk homing device!? Get the point...

>Why not have the computer protect the user from accidents with disks the
>same way they're protected from accidental shock..?

As I said, that's an inaccurate anology since destroying a floppy is not life threatening.

>The point is, it's STUPID to demand to be able to pop the disk at any
>time you want to... the only time the computer WON'T give it back is when
>it's writing to it... when it's done updating, it ejects the disk.

>The same as the "semi-competent computer user" would do...

But a semi-competent user may not have a pin handy when the Mac crashes (hardly an infrequent occurrence) with a disk in the floppy drive and won't start up again. If an IBM-compatible crashes, at least you can just pop out your disk and leave (it may lose updates done to the disk cache, but the disk cache is deleted when the computer crashes anyway).

>BobR

I should I have to put up with inconvenienced built into a computer just because some people are too stupid to know how to use the machines??

I'm now mostly a PC user, have 486dx266 vlb this and that....

I miss the ease of use of the ST. It didnt crash, seize & freeze like this machine does. The mac is better than a PC but still wasnt as easy to get going as the ST. Maybe I'm waxing over 2 year old memories, but the ST seemed mighty powerful and eay to use for its time. (I just got the gemul8r card, works, Darek gives great support, but the jusry is still out-- do I really need it??)

I find your arguments usually well reasoned and sensible, but as a
Falcon owner (and previous ST owner) I can tell you that in the
six years I've had Atari machines taking the disk out of the drive
during access (yes even write) has never screwed any data up, it
just asks you to put the disk back it then it carries on.

That's one of the 'few' good things about Ataris ;-)

: Again, it's not the usefulnes of any one ST feature that's the problem, it's
: that there was never any coherent program of advancement applied to the product
: line. Most of the new models were just old models repackaged in different
: cases and with a little more "chrome".

I had A Mega ST 2 with a megafile 30 harddrive and uopgraded it a Mega
Ste 4, in your opionion an old model repackaged. I sold my Mega 2 for
about 1100 US $, and got for the difference the new model. This new model
had twice as much memory, twice as much CPU speed, 50% more Harddrive
space (integrated into the casing, so no fooling around with cables
etc...), faster harddrive acces with autopark, new serial interfaces that
are several times as fast as the old ones, a HD disk drive, a socket for
the 881, and an
improved, more bug free TOS. All these features are absolutely essantial
for my work (well, I replced the 48 Mb harddrive later by a Fukjits 135
MB drive); to put all the improvements into my old mega, I would have had
to buy a TOS 2.06 card, a HD drive module, tht never really work
reliably, would have had to saw the casing to fit in a PC HD drive, would
have had to buy a new Harddrive, a patchboard for the serial interfaces,
a 881 FPU card and an accelaerator; all together much more expensive than
the new STe and with more problems involved (do ll theparts work
together? etc..)

This is exactly the way Atari should have gone, and this is the way PC
and Mac industry goes. They constantly offer newer computers with small
improvements. Atari alawys wanted to do one model, sell it for years, and
then replece it by a new hype model. There was no need for a Falcon040. A
TT040 in a Tower casing would have sufficed (with 2 or more A32/d32 VME
slots). Why was there only one version of the TT? Why wasn't the EST,
apparently an Ste with 020 processor, released? What about the Blossom
graphics chip with Dual Ported Video RAM, that was produced for the ATW?
Atari did very wel to repackage the ST in newer models, such as STe and
Mega STe; they should have done that with the TT, too. That's what Apple
does, and they do that very succesfully.

Regards,

Alfred

Robert,

1. There's a comany in Germany Called C-Lab who have licensed the Falcon technology from Atari. They are engaged in some form of digital audio related business. Here are their details:

C-Lab Digital Media
Am Stadtrand 39
22047 Hamburg
GERMANY

Tel: 0049-40-694400-0
Fax: 0049-40-6961555
Compuserve-ID: 100 434,37

2. For your interest, my company produces a product based on the Falcon, SONOVISTA. You can read about it on our Web page at:

www.tecnation.com/tecnation/

Click on OUR PRODUCTS and click on SONOVISTA.

As I said, "MOST of the new models were just old models repackaged...

The Mega STe was the FIRST of the ST line to be seriously advanced beyond the previous models. The features you mentioned made it a true evolutionary step, not just a trivial incremental improvement like the other models were...

If only Atari had come out with the Mega STe YEARS before it was released, things might have been quite a bit different.

Unfortunately, by the time this excellent new ST was released, the Atari computer was in a power dive into oblivion, and even the Mega STe couldn't stop it.

I may still buy one...

>... taking the disk out of the drive during access (yes even write) has
>never screwed any data up...

The question is (and my point in all of this), why would you WANT to take
the disk out of the drive while the system is updating the directories..?

The "Mac is a piece of crap because it won't give me the disk when *I* want
it" argument is stupid precisely because the only time the system WON'T give
you the disk is when it's writing to it... a time you shouldn't WANT to take
the disk out of the drive, no matter WHAT system you're using.

If you accidentally pop the disk on an Atari system it asks for the disk back..
a Mac doesn't let you accidentlly pop the disk... why does that make it a
piece of crap..?

I know that it's a remote probability that a disk will be damaged by removing
it too soon, but the argument that the Macintosh is somehow inferior because
it attempts to protect the user from that possibility is, in my opinion,
nothing more than stupid.

Congratulations. You've managed to pick out one minor shortcoming of the Mac.
Of course, I could always mention 8+3 filenames, a totally modal Desktop,
inconsistent interface and lack of support for basic OS features among
applications as shortcomings of TOS...

No, that's exactly NOT what I said. The whole point is that the OS
should now be considered to be MiNT/MultiTOS. At least that's what
the baseline is for software development.

% I think 90% of the owners of Atari computers would be pretty surprised to find
% that the OS in their computers was suddenly NOT TOS, but was instead "MiNT or
% MultiTOS"...
%
% As far as I'm aware, the number of people using MiNT or MultiTOS is vanishingly
% small. The computers still come with TOS installed, which sort of seems to me
% like it's the "OS"...

Yeah yeah yeah, and my PC has DOS 5 on it, but I run it under Linux.
Perhaps it's a DOS machine?

Since simply putting an auto-folder program on the disk is all you
need to do to get MiNT (and it's free!), I can't see that it'd
be a major problem for people.

Falcons come with MultiTOS installed as well as TOS. (At least here
in the UK)

ANd one which crops up regularly. I lave a mental list of about 100 such
things "wrong" with the mac. Hence, I don't use them.

As for your points:

8+3 : It doesn;'t bother me. As I said, I keep an organized drive, so I don't
need names like "Bob's Summer 1988 FInancial report" It could be "reports/
financial/s1988/bob.rpt" and it means thre same thing. the PATH and good
use of directories makes really long filenames almost unneccesary.

(note I said "almost" -- I would prefer to have them of course (unix style,
not mac style) but it's hardly a crucial need to use 32 characters in a name
with spaces and punctuation marks)

modal desktop: MultiTOS? Less Modal than sys 7...

"lack of support for basic OS features": now there's a highbrow-sounding
content-devoid sentence if ever I saw one... Do you mean that poorly-written
applications don't use the OS? Well, hardly Atari's fault, and there are good
apps out there...

>The fallacy of your argument is outlined. None more need be said.

I assume you're referring, as you have in the past, to the propensity for the Mac to crash every 15 minutes, thus rendering the power eject mechanism inoperable, necessitating the use of a bent paperclip to remove the disk..?

Aren't you the one whose PC crashes 10 times a day..?

Odd, isn't it..? There are millions of people in the world who happily use Macintoshes and PCs day in and day out without ever encountering this kind of behaviour from their computers... you don't think it could be a severe case of operator error, do you...?

Perhaps your desire to remove floppies when the system is writing to them is indicative of the general problem..?

(If you're NOT referring to the Mac crashing every 15 minutes and thus keeping your floppies, maybe you'd care to explain why "..the only time the system won't give you the disk is when it's writing to it.." is a fallacy..?)

>who will use the 68060 anyway..?

The 680x0 CPU line is used in an entire WORLD of products far beyond the miniscule sales the Atari and Amiga lines generated.

The nationwide data communications network my company runs uses 68030 based VME systems now, and with the increased need for data throughput will likely move up to 68040 (or if they become available, 68060) processors. VME systems in general are pretty much based around Motorola 680x0 CPUs. Scientific and industrial applications use millions of them.

I doubt a microwave oven will ever need the speed of a 68060, but they DO use the 68000 for control, as do many other appliances.

I doubt Motorola even noticed a dip in their sales from the death of the Atari and Amiga computer lines...

Simply because Linux is available, and a small number of people use it doesn't suddenly make it THE operating system for the PC...

Likewise, just because there's a freeware curiosity called MiNT that a very small number of people use doesn't suddenly make IT the operating system for the ST...

If it's the one YOU use, then great... it's THE operating system on your system.

For the other 99% of ST users, TOS is still THE operating system.

I really don't know that many individuals who own Falcons, but I wonder just how many really DO run MultiTOS as their default operating system, and take the memory and speed degradations involved...

>with spaces and punctuation marks)

I find descriptive names indispensible. Calling a file "Sales Report - March
1995" is easier to understand (and better, since it eliminates directory
clutter) than "C:\REPORTS\SALES\MRCH1995.TXT." This is an example of how
the Mac conforms to the users' needs instead of forcing the user to conform
to its needs.

>modal desktop: MultiTOS? Less Modal than sys 7...

I'm not talking about MultiTOS for several reasons:
* most people don't have MultiTOS
* MultiTOS won't run on the most common Atari machines still out there
* Even Atarians will admit that MultiTOS is not very speedy

>"lack of support for basic OS features": now there's a highbrow-sounding
>content-devoid sentence if ever I saw one... Do you mean that poorly-written
>applications don't use the OS? Well, hardly Atari's fault, and there are good
>apps out there...

I can't think of very many applications which fully, properly support (or
even support at ALL):
* the universal clipboard
* GDOS fonts
* Atari's user interface guidlines

Every Mac application, on the other hand, supports the clipboard, Mac's font
and printing system, andso on.

: due to lack of games and distribution. I still cannot see it at Wal-Mart.

Hey Peter ... think of something. The Sega deal set a precedent.
Atari is now able to sue dozens of other developers and manufacturers and
get more money. The lower price will likely help the distribution and
there are lots of games in development to remedy the software problem.

: The local Software etc. has a selection of over 3do games promintly displayed
: on the wall next to Pamasonic and GoldStar 3do's..

The local EB has all the Jag games prominently displayed as well.
The Microplay in Ottawa has the Jag display set up so it's the first
thing the customer sees when they walk in the store. The also have a huge
Jaguar banner and a kiosk so people can try out AvP or Doom. The kiosk is
always busy.

Robert J Goos (goos@badlands.NoDak.edu) wrote:
: OK, Atarioids, it's time for this newsgroup to live up to its name...

: I am requesting that ONLY DIE-HARD, LOYAL Atari owners answer here.
: Complainers, flamers, etc., can start their own threads.

: I am requesting that those of you who like, enjoy, love, etc. the Atari
: platform to follow up this posting by answering the following questions:

: 1. Why do you like your Atari computer?

Almost everything. There are some things I'd change -- some things I have changed, and am going to change -- but overall I think it is an excellent machine all round. I compose MODs, program, write, modem, do artwork and myriad other things with this machine with simple and efficient ease, without eating up all my system's resources (indeed, not by half) or chewing up obscene amounts of hard disk space for a single program. Additionally, Atari machines are not fixed. If there is something about them you don't like,. upgrade that part. Graphics too low? Get a graphics card. Too slow? Get an accellerator. Hard drive? Anything at all is available with hardware such as the ICD Link II. CD-ROM? Ditto. (And there are quite a number of Atari-specific CDs out there) At present, I own a Mega ST4 with 4 megs of RAM, and will be upgrading the seiral port soon (Thanks, Andy!) so that I can get more than 19.2k out of it. It is a dying machine, but then it has been around for nearly ten years, which is a pretty good track record by any machine's standards.

: 2. What does your Atari do (or do more efficiently, elegantly, etc.)
: better than other platforms (particularly Windows or Mac)?

I use NeoDesk as my desktop replacement. As far as I'm concerned, it makes Windows (and kin) and OS/2 look downright silly. Neo 4 has all the features I could ever hope for in an OS extension, and only consumes perhaps 500k of disk space, and less than that in RAM. Compare that to Windoze taking up 20 megs of disk space and requiring at least 4 megs of RAM -- 8 megs to run comfortably, or OS/2's propensity to chew up 7 megs for itself and run like a lazy dog. But it's not so much an issue of what this machiend oes *better* (or worse) than another machine. It's how it does it at all -- it's the differences that attract us to the platform, not necessarily its better or worse capabilities. It is like using one word processor over another; they may all have the same capabilities, but one may be more to your liking simply because it works more the way you like.

: Please feel free to wax eloquent, and please mention for me what Atari
: model you are so attached to.

: I'm not an Atari user, but would be quite interested in knowing what you
: find so appealing about your chosen platform.

: Thanks a lot...

Bob,
I believe what made the Commodore such a success was the fact that it was so darn inexpensive. Atari tried its darndest to do the same with the ST (Power without the Price). However, by this time, I believe that IBM and Apple were just too huge to compete with. If American consumers were not affected by advertising and chose the best computer for the best price the ST and the Amiga would have done as well here as they did in the rest of the world.

There is supposedly a software only ST emulator for the PC, but I really don't know anything about it...

The other emulator is the GEMulator board from Darek Mihocka, who wrote many of the successful emulators for the ST.. the board is $99 and fits into your PC like any other half-size board. It requires a set of original Atari TOS ROMs, which will add about another $69 to the cost.

With a good 486 you can run Atari ST software at the same speed or faster than an actual ST.

There are still some incompatibilities with the Atari system.. I don't think the current version supports the MIDI ports for example, and games with on-disk copy protection may not work, but otherwise it's a great emulation of the ST...

For more information write to darekm@microsoft.com and tell him I sent you..

:)

>It's not a "piece of crap", it's just that it is an unnecessary feature.

Hmmmm... you mean like those MIDI ports that I PAID FOR on my Atari STs, but never used for anything more than an occasional game of MIDIMaze..? (And have NEVER used on my STe..?)

Like the VME bus slot that probably 99% of Atari owners paid for, but will never use..?

It's just a design feature.. whether it's unnecessary depends on the personal point of view of the individual.

The original assertion in this little discussion was that the Macintosh system is somehow unacceptable because it won't give the floppy disk back on demand.

My assertion is that that particular argument is pretty stupid. It doesn't make the system run programs slower, or affect its graphics resolution or numerical accuracy.. all of which WOULD be serious considerations. It sounds to me like a minor whine from someone who can't really find anything serious to complain about.

>What does a Mac replacement disk drive cost?

I have no idea... and that really doesn't have much to do with this particular discussion.

>If American consumers were not affected by advertising and chose the
>best computer for the best price the ST...

Unfortunately, American consumers in general never even HEARD of the Atari ST, nor were even aware of the fact that Atari even made computers.

Atari seemed determined to keep that fact a secret from everyone who might be interested in buying a computer, except in very limited niche markets like music production and very briefly, "direct to press" publishing.

Atari relied on, and in fact even asked us to participate in, "word of mouth" advertising, instead of investing in themselves and their products, and spending the money it would take to introduce their products to the buying public in a way that would not only make them aware of the products, but would also tend to engender some credibility in the minds of the general public.

The only people who really knew anything about Atari computer products were the people who ALREADY knew about them... and as we saw, you can only sell just so many units to people who already own your products.

It's difficult for American consumers to buy a product which they've never heard of and which they can't find in a local store.

I think that, more than anything else was what spelled the demise of the Atari computer...

Nope, to be precise, TOS is a CP/M 68K derivative, MiNT (the MultiTOS kernel) is a Unix derivative!

>And it has Unix
>development tools, and networking stuff like TCP/IP, UUCP, Usenet, etc.
>This makes a perfect, low-cost net surfing vehicle!

If only Atari wanted it :-(. The Jag chipset is ideal for smaller displays (handbooks, e.g.), and if MTOS would be developed some more, it would improve greatly (first, getting rid of GEMDOS in it's recent form would be a big step forwards, and buying some programmers like Martin Osieka (WinX/WinCom) who already started developing MiNA (MiNA is Not AES), would be ... err... more than satisfactory). But I doubt it will happen :-(.

Well, I personally don't like the Mac's concept of telling me what to do and what not to do, but I strongly advise anyone who just wants a computer to immediately start working to buy one.

It's just that Peter is clueless, as any of my questions proves. He doesn't know about the Atari or it's software, he claims that upgrading a computer with <=512KBs of ROM is easier than upgrading one with 2 megs or ROM (Peter, ever heard of programs like ROMSPEED, that copy the ROM to RAM?), etc..

He is perhaps the most ridiculous advocate under the sun, but I guess there are some competitors for this title :-).

The current pricing of the Jaguar system is $189.. that includes the one packed in game. Atari is also currently running a promotion for one more game and a second controller when you send in a coupon and proof of purchase.

There will supposedly be a new "core system" priced at $159, without the packed in game, to be available in March.. which coincidentally is the expected release date of the CD-ROM addon.

That means you'd be able to buy a complete CD-ROM system for right around $300, without the cartridge pack-in that everyone's complained about, but with one CD-ROM packed in game.

Sounds like a good pricing strategy to me.. now if only they could make enough units to achieve a good general distribution.

In what way does the Mac tell you what to do. Is this the reason? When I load the extensions onto my HD, my Mac asks me if you want it in the extension folder and I click 'ok'. Sounds logical to me.

I don't know what you are getting at? If you mean if it's easier to upgrade the OS through disk than rom, the disk is more convient. As for memory, it's not an issue for me since I have lots of it. If your precious Atari OS had the functionality as mine does than your memory requirement would be greater. It's a fact Jack..

>Additionally Atari machines are not fixed. If there is something about them
>you don't like,. upgrade that part. Graphics too low? Get a graphics card...

This is one of those bits of misinformation I was objecting to.

Left by itself, and unchallenged, it would give a completly misleading picture to anyone unfamiliar with Atari computers. It borders on being completely false.

Atari computers were NOT designed to be expandable.

They were designed to be "appliance computers"... take them out of the box and run them forever they way they came. If you want more memory than came in the computer you bought, the "Atari upgrade path" was to somehow get rid of your current computer and buy a completely brand new system from them that comes with more memory installed. Atari representatives often comfirmed this very point of view.

Yes, third party hackers found ways to hack and slash the hardware to add capabilities that were not designed into the original hardware, but it is hardly as easy as "Get a graphics card". The way it was stated, it sounds as if all you need to do is run to the corner Atari store and get a video card, just like you'd buy a PC video card, then just slide it into a a convenient expansion slot, again just like on a PC.

In the case of the ST line, with the exception of the Mega Ste, nothing could be further from the truth. Adding a graphics card is not an easy proposition in the very best case. If you've already hacked your computer to add more memory (usually pretty messy) and tacked in an accellerator card (again a technically tricky procedure), there might not even be enough physical room inside the case to add a graphics card.

It wasn't until the STe was released that Atari included any kind of easily upgradable memory, and even then Atari representatives said that the switch to SIMMs and SIPPs was designed to make it easier and cheaper for THEM, NOT for the convenience of the buyers. They STILL wanted to sell you an new computer with more memory in it if you decided you needed more. (Of course, if you weren't unlucky enough to have bought an STe with soldered in SIPPs, it was fairly simple to add your own SIMMs.)

Adding an accellerator to an ST usually means unsoldering a 64 pin CPU chip from the motherboard (Atari didn't believe in wasting 89 cents on a socket), and adding a socket to plug the accelerator board into. Most installations also require the soldering of several other wires to various places on the motherboard. NOT at all like plugging in a new CPU chip on a PC motherboard.

The STe model uses a surface mounted CPU chip which can make it very difficult to add anything to the system.

The TT was the first Atari system to allow you to simply plug in a new video card. It and the later Mega STe have a VME semi-compatible slot which allows you to plug in non-busmastering 3U size VME cards. However there is only one slot, and just about all the cards have to be specially designed for the Atari systems, since 3U is not a very commonly used size.

In addition to the technical problems, the cost of upgrading an Atari system can be almost obscenely excessive.

High resolution graphics cards cost many, many times what a PC owner would have to pay for the same capabilities, due to the extremely small Atari market, meaning there is almost no economy of scale operating to help reduce the costs. Prices can be on the order of $999 or $1500 for a board which may or may not work with your particular software applications.

CPU accellerators can cost as much as a complete computer system on other platforms.

In short, Atari computers were NOT designed to be expandable. You CAN expand them with third-party addons, but these are generally difficult to install, and can result in decreased reliability of the system due to the methods of installation necessitated by the closed design of the system. In addition, expansions can be very expensive.

Before anyone flames this, remember that the original question was asked by someone who said they were not familiar with Atari computers. Giving them misinformation or wrong impressions is not doing them any service.

Atari machines were not designed to be expanded. Voids the warranty if you try
to hack the computer with a graphics and accelarator card. On the Mac, you can
program, do artwork, write, modem and mriad of other things. As for the cdrom,
its not officialy supported by Atari and their is a miniscule amount of titles
if any. The Macs and PC's are a much better buy than the $1300 Falcon. You
can get an 040 Performa 475 system with software bundle for $1099. Includes a
monitor.. Atari software is severly lacking in par with PC and Mac software.

The Atari OS is out dated and it shows. If the Atari OS had the same
functionality as System 7.5 on the Mac, than it would break the ST. Lets face
it you need to find a platform that is supported..

> has a future...

I've assembled many PCs. I have found them interesting, and it is educational to use a PC and be familiar with the machines because they are so prevalent. However, I don't think they are a "joy" to use. Those device drivers get stacked up there PRETTY DARNED HIGH by the time you get (1) HIMEM.SYS, (2) EMM386.EXE, (3) SCSI driver (or Enhanced IDE driver), (4) MOUSE driver, (5) CD-ROM bus driver, (6) MSCDEX (DOS CD-ROM driver)....etc...etc... Better hope that they all work together.

It's also ridiculous to have to juggle memory around like that, and have NON-LINEAR memory.....I am not too dumb to understand the "types" of memory, but in my becoming familiar with the DOS computers for the first time, I recognized this as bull**** that no other computer in the world has to deal with.

What kind of rationale is it to compare your 66Mhz (or whatever) PC to your 8Mhz STe and conclude that the PC runs "orders of magnitude" faster? Should it not? Is this a fair comparison? Have you ever used a 8Mhz PC? Try to run the equivalent of GEM (WindoZe) on it. While you're marveling at how much faster your PC is than your STe, why not make a laughing comparison at how your PC outruns the 1.79Mhz Atari 800, or the Timex Sinclair 1000, for that matter....so what?

Playing DOOM is not really what *I* would consider to be criteria for computer purchase. If I wanted to play Doom really bad, I'd buy a home video game system that plays it. I'll admit that I've spent seveal hours in front of a computer playing DOOM, but DOOM GETS OLD FAST. By the time DOOM II came out, I was bored with the whole concept. There's another NEW game in the series....same old concept....same views...different weapons...same scenario...go around killing things. Anyone who is STILL mezmorized by DOOM must be a teenager.

Your PC "has a future?" That can be debated. The PC had a future in 1981...a very LONG future which has brought it from then until NOW.

However, if you think that it is going to continue like that, THINK AGAIN!!! Enter POWER PC.... I believe this may finally be the horse to throw the Intel line. It'll be a great day for micros if the PPC ever establishes dominance. It may be a long time coming, I'll admit....with all the DOS boxes selling now. The upcoming '686 uses every acceleration trick known to Intel (caching, multiple pipelining, instruction prefetching, branch prediction), and is supposed to be the last in the line for the x86 lineup. Face it...how far can you cary BACKWARD compatibility with a 8086, when you're attempting to compete with kick-ass PowerPC chips? I don't mean to knock ANYONE's choice of computer, but I salute Apple for going with the PowerPC. By going PPC so early, there will probably be a PowerMac software headstart for a long time, over the many PPC computers that will come to exist in the future (Toshiba, Canon, etc. are all working on PPC machines).

> Funny how the Atari supporters' arguments usually end up being personal attacks
> when they run out of logical and factual arguments to hold up their end of
> the "discussion"...

That's not as funny as all the users of other computers (ex-Atari users too) hanging out in comp.sys.atari, trying to be "Jesus" to everyone who still uses an Atari, and preach to make the switch to whatever PC or MAC he uses, and thus provide Atari users with Eternal Salvation. NO THANKS....WE DON'T NEED YOUR PREACHING. Go on and enjoy your PC or MAC...just allow us to use our Ataris as we please.

Hey Peter!! I think it is silly and pointless to pit the Falcon against
a line of constantly-improving Macs. The Falcon IS WHAT IT IS.... It
was produced exactly as it was...and is hardly produced anymore. The Mac
hasn't stopped evolving. THis is no basis for comparison.

Now... Other than that...I find the upcoming 2nd gen. PowerMacs to be
interesting. I think they're great; I just don't think the proper way to
look at them is to use them to put down a Falcon.

I can think of more than one occasion that I've forgotten which disk I had in, and attempted to delete or format...then hit that disk eject bar as fast as I could...and saved the data.

Also, when it comes time to turn off machine, I hit the disk eject and power switch...then I'm done. Gees....I have to wait for my computer to boot up....why should I have to WAIT FOR IT TO EJECT THE DISK AND SHUTDOWN?

I don't think that Macs are crap at all, and as someone else pointed out, you don't use the floppy drives much anymore, anyway. I think the point still stands, however, that the "no-eject-button-drives" are of no advantage. That would be my 2 cents. I don't think they make the Mac suck, but they take more time to eject the disk, and they must cost more money than a PC 1.44 disk drive. I can buy a standard TEAC 1.44 Mb drive for about $45 most anywhere. How much is a Macintosh floppy drive? Somehow, I believe this question will go on ignored, as I'm sure any Mac owner knows it's probably double that.

This is a very poor comparison. The MIDI ports and VME slot are for EXPANSION capabilities. Now here you go slighting Atari for including a couple of avenues of EXPANSION. That's proof that you are off-base. I guess PC users should cuss the maker of their PC for every free slot they have in the system, to use your rationale. I guess they should get pissed at their "overdrive" slots, since most will be unused.

The "no eject button" disk drive is NOT an expansion; it is a needless feature. It can't be compared to an expansion slot or port which was never used. The fact that the MIDI ports and VME slots sparked 3rd parties to make products which utilize those slots and ports. They products were then available to Atari users, if and when they decided to expand. Since you've made the comparison, I ask you what innovation is sparked by the "no eject button" floppy?

>
> It's just a design feature.. whether it's unnecessary depends on the personal
> point of view of the individual.

No, I believe it depends on a point of view of the rest of the industry. There are a lot of computer makers, and a lot of computers have been made. How about a list of those (besides Macintosh) that used the "no eject button" floppies?? Hmmmm??

>
> The original assertion in this little discussion was that the Macintosh system
> is somehow unacceptable because it won't give the floppy disk back on demand.

No....one paragraph above you state that the assertion is "whether it's unnecessary" (which it is), not whether or not it makes the entire Mac useless (which it does NOT).

>
> My assertion is that that particular argument is pretty stupid. It doesn't
> make the system run programs slower, or affect its graphics resolution or

> to me like a minor whine from someone who can't really find anything serious
> to complain about.

HA HA HA!!!! And earlier in this same post, you slight the Atari for
having MIDI ports which make the computer "sound" better and do more
tasks, and a VME slot which *MAY* affect graphics resolution, if a VME
graphics card is in there. (Howling with laughter, now).

>
> >What does a Mac replacement disk drive cost?
>
> I have no idea... and that really doesn't have much to do with this particular
> discussion.

HA HA!!! It has everything to do with this discussion. The fact is that
it's a needless feature, and is probably expensive. If you don't believe
it has anything to do with this discussion, I'll introduce it now:
A standard TEAC 1.44Mb floppy costs $45. WHAT DOES A MAC SUPERDRIVE COST????

The answer is (2).. your reply flagrantly wasted bandwidth, not truly sure about the grating nerves part, although that could apply too.

The answer for the "Not many..." reply is (1). It answered the question in a general, non statistical way. Incidentally, your reply didn't answer the original question at all.

(The actual answer to the original question of how many Falcons have been sold is a lot closer to "Not many..." than you'd want to hear.)

Golly, James, you sure are a jovial fellow, aren't you..? Good to see that you can keep your sense of humor about all this, even if you do seem to have a bit of difficulty reading, and applying logic...

The original beginnings of this thread contained a statement that the Macintosh is somehow inferior because it won't give the disk back when the complainer wanted it. If you could read at all, you might want to go back and brush up on the earlier posts in this thread.

It had nothing at all to do with the cost of a Mac Superdrive.. if you want to throw that little bit of tangential nonsequiter into the discussion, feel free, but it has nothing to do with the subject matter.

The more recent turn of the discussion centered on useless things, the claim being that the disk ejection feature of the Mac while not making the Mac itself "crappy", was a useless thing.

My point is that for me, and for probably 90% of Atari computer owners, the MIDI ports and the VME slot are "useless things".

Your comparison of these features to the PC's ISA slots is a bit off...

The slots in the PC are completely non-dedicated, fully generalized expansion slots. The MIDI ports on the ST by comparison are HIGHLY SPECIFIC ports, and for most people, COMPLETELY USELESS. A PC owner can insert virtually ANY kind of device into a generalized ISA slot.. video card, sound card, CD-ROM interface... whatever. On the other hand, the hapless Atari owner, who paid for the MIDI ports has a VERY LIMITED choice of devices he can connect. If he's NOT a musician he's pretty much screwed, unless he can get a few friends to bring their STs by and play MIDIMaze. (Yeah right.. there are a few beta copies of a network that runs through the MIDI ports.. so what..)

Likewise for the VME slots. They are almost COMPLETELY WORTHLESS. In the first place, they are NOT a fully compatible implementation of the VME standard. In the second place they are 3U size, which is NOT a very common size for VME cards. In the third place there are ALMOST NO cards which an Atari owner can use. In other words, the VME slot is almost COMPLETELY USELESS.

And yet, just like the Macintosh owner, the Atari owner had to pay for them.

Given the choice between paying for a generalized, useful expansion slot and one or two highly specialized, almost worthless expansion connectors, which do you think most of the world would be interested in paying for..?

Ah.. yes.. speaking of the "rest of the world"... (HA HA HA!!)

Since there are a lot of computer makers, and in your opinion industry acceptance of a feature is the ultimate judge of its usefulness, how about

GEM..? There are a lot of computer makers, and a lot of computers have been made.. how about a list of those using GEM, eh..? (HA HA HA!!)

(Sorry for the tangential nonsequiter.. I was just feeling a little jovial myself.. still laughing from your message...)

To get back to my original overall point.. the argument that the Macintosh is inferior because it "won't give the floppy disk back when *I* want it" is stupid. There are much more important things on which to judge a computer system.

On an Atari or a PC you have to jump to eject a floppy if you accidentally start to delete a file... on a Mac it puts the file into a trash can and doesn't actually delete it until you confirm that you really DID want to delete it.

If you think you can react fast enough to pop a disk before the FAT tables and directory get overwritten during a format anyway, you should be on some Olympic team or catching flies with chopsticks.

As for shut down, an Atari ST is a very simplistic system compared to a Macintosh. The Mac has more to do when shutting down from a session than an Atari does, including writing the positions of everything on the screen to disk so it can put everything back where it was when you boot it up again.

If you don't care about that, fine... don't use a Mac.

Most computers of any complexity have a definite shutdown procedure. They have to stop multitasking processes, log off multiple users, shut down batch and print queues and save the status of any pending jobs.. that kind of thing.

An ST can be just switched off because it's a relatively unsophisticated machine.

Do you shut off your car, put it in Park or Neutral, set the parking brake, roll up the windows in case it rains.. or do you just jump out when you get where you're going..?

Next time you're thinking that the Mac disk drive has an unnecessary feature, try popping a disk out of your Atari during a directory update, then quickly stick a DIFFERENT disk in it, just as someone in a hurry might do..

Then try to use the second disk again...

Re: "Fair comparisons"...

The first PC I put together was a 10 Mhz XT clone... and I was completely amazed and somewhat dismayed by how much faster it ran than my 8 Mhz ST, expecially after hearing everyone laugh and put down PCs for being "so slow".

It's disk access, which was one of the widely touted advantages of the ST, was far faster than the STs. Read/Write access to the floppy disks was quite a bit faster.

It's throughput was better too. UnARCing files, UUDecoding, that kind of thing, was much faster on the XT. (Of course the efficiency of the relative programs would affect that, but those were the programs I had, and those were the results I saw.)

Naturally it's unfair to compare an advanced 32 bit, 40 Mhz CPU with a quarter Meg of fast external static RAM cache against an 8 Mhz, 16/32 bit computer.

If Atari had kept up with the rest of the world maybe they'd have something we COULD compare to.

So device drivers "stack up".. so what..?

You install the drivers you need for the devices you have. You install them, configure them, then leave them alone.

Those AUTO folder programs tend to "stack up" too, expecially the ones that are released as "bug fixes" for the buggy ROMS (which can't be updated very easily)... AND... the AUTO folder programs have to be added to the folder in the correct order, or you run the risk of locking up your system and making it so you can't even boot your computer. (That's one of the number one cries for help I get from Atari ST owners. I have to help them boot their system from a floppy, then rename all the AUTO programs until they find the one that's causing the problem, then help them re-arrange the programs to find a configuration that will work... I have to laugh whenever I hear Atari owners putting down PC owners because they have to "fiddle with AUTOEXEC.BAT files all the time".)

Juggling memory..? Why..? Just run OS/2 and use all your memory contiguously. (Before you object to using a different OS, that's the answer *I* get from Atari owners all the time.. "Oh, your problem is you're still using TOS.. you have to install MiNT and Linux then run X-Windows and MultiTOS to get anything done..")

Also, why point to the 640K memory limitation as something to laugh about..? The Atari ST has a 4 Meg memory limitation that is far more fatal than the memory limitations on the PC, and the Falcon hits the wall at 14 Megs. The

motherboard in my PC can take 64 Megs with no problem at all... and with those memory managers you're so afraid of, or better yet OS/2, can use all of it.

Compared to any Atari computer, the PC has a long and productive future before it... the PowerPC will have a VERY tough job dislodging the installed base of x86 PCs in the world today. The very inertia of those millions of machines guarantees a long life for the platform. I'm not saying the Intel platform is any better than any other, but that's just the way it is.

In any event, even if the PowerPC succeeds in supplanting the Intel 'x86, it won't look like an Atari or an Amiga, or even a Macintosh.. it will "look and feel" like an IBM compatible. That's the only way it will be able to be sold to the millions of computer users in the world.

And, before you complain about owners of any other platform "Preaching" at you, try to remember that this message thread started out with Atari owners "bashing" other types of computers trying to make their Ataris look better to themselves, instead of just enumerating the good features of the Ataris.

Is he "sad?" You introduce *emotion* into the situation??? Peter...I don't intend to be nasty, but it is *YOU* who are emotional here. How do I know?

Well....you DON'T use Atari computers. You clearly advocate and use Macintosh computers, which is perfectly alright. However, you hang out in the Atari advocacy and preach Mac advocacy....while putting Atari down. To quote Mr. Spock, "That is illogical." Furthermore, you put down Ataris in almost every message: You put down the computers, and you put down the Jaguar...calling it the Jagflop. It's illogical, because, as Mr. Spock would say again, "It's emotion, and emotion is illogical."

Spock would be right! How can there be any logic here? I've seen you post messages telling people to "GET OVER IT." However, you never seemed to "get over" some kind of broken heart that Atari gave you....otherwise, why would you expend the efforts to hang out on the Atari forums? I can understand PERFECTLY that a Macintosh user can hang out here; and in fact, they are welcome!! A Macintosh user who comes over here and blows the Macintosh horn all day...is welcome too. As a matter of fact, I found the long post about the new mid-'95 Power Macs to be very informative.

But a Mac user who blows the Mac horn **AND** constantly puts down Atari computers **AND** videogames??? You absolutely **HATE** Atari...and your behaviour is indicative of STRONG emotion in that regard. Is that so? Can you think of any other reason why someone would make such a dedicated effort to TRASH Atari CONSTANTLY, ALL WALKS OF ATARI, and promote Macintosh??? I can understand someone choosing Macintosh...but to trash the Jaguar...promoting the Super NES???? Come on....I don't have a Jaguar (yet), and I agree that there isn't much support, but I don't see how ANYONE could trash the Jag hardware. That is, unless there's some powerful emotion at hand.

So tell us, Peter, what did Atari do to "break your heart" and stir up such strong emotion? Now, I'm not going to say that Atari hasn't let me down in the past...they've let EVERYONE down, and started with letting down 8-bit users when the ST came out. However, I never let it rile me to the point where I just flame constantly....forecasting doom, denouncing EVERYTHING with the fuji sign as trash, and preaching to Atari

users to convert to such-and-such platform like Jesus Christ himself, trying to save Atari users from an eternity of damnation...or just trying to look "right" and getting others to pat me on the back for making the switch. Is that it? Is that why you hang out in Atari forums? Are you still interested (emotionally attached) to Ataris, but made the jump to Apple, but need some kind of emotional support and guidance (from Atari users) for having made the switch? Do you, perhaps, feel more comfortable for having made the switch, only if your believe that Atari totally sucks, and doesn't have/never had/never will have ANY product worth a hill of beans? Would it be easier on your emotion to close the book on your Atari affiliation for good, if we all agreed with you on this?

Of course, this is all highly speculatory....But I see similar behavior between ex-lovers. It's more comforting to denounce and "ex" as a totally useless so-and-so, than to let them go admitting ANY virtue. They usually like to get in a few plugs for their new lover as well. I know this sounds silly in application to computer brands....but I'm not the Apple user who's so dedicated to denouncing Atari and plugging Apple....in the Atari forum!!!

James

Y'know, for once Sinclap might be onto something. Atari, with a pile of patents and a pile of lawsuits in the works, could set the money aside so that they could really do things right. While the Jag is already out, Atari could secretly invest in another project (ie. 16/32 bit handheld game system) and pay a lot of developers to develop games beforehand. Without announcing it, the product could pop up at some CES with an armload of ready to go games, as well as a big ad campaign. It would certainly help Atari back into the mainstream again.

>You have the same feature on the Atari, it is call save desktop.

Indeed... and the Mac saves the desktop every time, the ST only when you click on the menu option. Different strokes for different folks. My explanation was only to illuminate some of what's happening when you ask the Mac to shut down.

Closing all windows and running applications is called an "orderly shutdown." You don't see it on an ST because the ST is a simple system. You SHOULD see an exit message asking if you want to save your file before you exit an application.. you don't get that second chance if you just pop the power switch though.

>>"Orderly shutdown description"
>If you are a home user, those possibility that you just describe do not apply.

On the contrary, when I shut down OS/2 it does many of those things. OS/2 is a complex system running a scheduler and print queues as well as multiple processes. Sure you can just "pull the plug", but why would you want to risk making a mess..? That's what "orderly shutdown" means... you don't need it on an ST because the ST doesn't do any of that more complex stuff.

If your car is in the garage, it's because you performed an "orderly shutdown" on it, including opening the door, driving the car in, and I'd assume, closing the door behind it.. you also probably put the car into Park so you could take the key out, and presumably to prevent the car from rolling into anything.

The equivalent to popping the disk and switching off an ST would be to jump out at the curb leaving the door open and the engine running.

>the Mac always ask me to swap at least 3 times with the one I just eject..

Have you ever tried to copy a disk on an ST with only one floppy drive..? Your arm will get tired of swapping the disk before you get through. Importing a file into a Mac application has nothing to do with what I was illustrating anyway.

If there's a power failure, then all bets are off... on ANY system.

MacWeek(2-27) on the new Macs

Apple will announce a trio of Macs in April in time for the educational marketUs buying season for the 95-96 school year.

-two will have new form factors
-two will have PowerPC processors
-all will have AV technologies

==========

The LC 580($1299)
-33 mhz 68LC040
-processor direct slot
-communications and video in slots
-14U monitor: 640/480(16 bit color), 800/600(8 bit color)
-socket for PowerPC upgrade card
-cdrom
-two speakers
-siupport 630 series cards

The LC 5200($1799)
-PowerPC 603 at 75 mhz with a 256-kbyte level 2 cache
-15U monitor: 800/600(16 bit color), 832/624(8 bit color)
-unit will sit atop a tilt and swivel base
-cdrom
-two speakers
-support 630 series cards

The PowerMac 6300
-PowerPC 630(75 mhz) with 256 level 2 cache
-630 chasis
-on board video: 800/600(16 bit color), 1024/768(8 bit color)
-support 630 cards
-no price given($1200 was floated)

Apple will release System 7.5 Update 1.0

-native Quickdraw and modern memory manager are faster
-file sharing is much faster, allows removable media to be removed
-Mathlib 2.0.1 greatly speeds some floating - point calculations
-Apple guide is native

-Eliminates some application errors with the modern memory manager
-scsi manager 4.3.1 suppoerts 630 series macs
-thread manager ready for PowerPC 603, 604
-incorporates several extensions :601 processor upgrade enabler

-040 vm update, 630 scsi init, PB 150 update, color classic update, EM sound fix

Atari should get out of the video game market, and become a holding company to collect patent money.. Atari will never recoup the investment from the Jagflop fiasco. But, were dealing with 'the boys', though.

That's a poor anaology, because as far as the ST is concerned, it's
off... there is not door open or engine running when you hit the eject
button on the disk drive, and then turn the power off. What the hell are
you talking about - the "engine running?"

True....but even a child knows that a Ramdisk (or hard disk) is an easy fix for this. I don't think I copied more than 2 disks that way in all the years.

BEEP!!!!!!!!!!!

Wrong answer! Would you like to go for Double Jeopardy?

This is comp.sys.atari.advocacy, not alt.mac.user.posts.for.atari please get
your postings right! =)

I know you don't like Ataris and and I know I hate cr-Apples so please
post something that this ATARI group would be interested in =).

Sure this is advocacy, but I ne'er saw anything about atari in the
last post, only that the educational system is gonna get worse =)

-jimmypai
BTW:
Constructive posts to the newsgroups
Flames to me directly...

>off... there is not door open or engine running when you hit the eject
>button on the disk drive, and then turn the power off. What the hell are
>you talking about - the "engine running?"

Sigh.. you really do need to improve your reading skills if you want to
keep up... let me recap for you.

1). Someone (I believe it was you, James) said they don't like having to do
a "Shut Down" on a Mac. They like to just pop the disk out of their ST and
hit the power switch.

2). I replied that for the ST, that's FINE... that's GREAT... that's JUST
WONDERFUL. NO PROBLEM... ON AN ST.

However, the Macintosh has more to do when it's turned off than an ST
does because the ST is a simpler system, so you have to tell it to shut down,
and not just pull its plug.

I then went on to describe the process of an "orderly shutdown" as relates
to computers which are MORE COMPLEX than the ST.

I then drew an analogy between shutting down a computer (which is MORE
COMPLEX than an ST) to parking your car in a garage.

Someone ELSE then said they might not have to do all those steps to park
their car, and besides, you don't have to do an "orderly shutdown" on a
computer system you're using at home.

I replied that yes, my PC running OS/2 does many of the things I described
that a MORE COMPLEX system would do, and yes, it does an "orderly shutdown"
when you tell it you're done using it. I also said that just switching off
the computer would be the equivalent to leaving the door open, and the
engine running... i.e., skipping one or more steps of an "orderly shutdown".

Now, since an ST is a SIMPLE COMPUTER, and DOES NOT NEED an "orderly
shutdown", obviously the analogy DOES NOT apply to an ST.

That's "what the hell I'm talking about"...

You want to pop the disk and hit the power switch ON YOUR ST, fine.. that
works just great. More complex systems need different procedures. You don't
like that, fine... don't use complex systems.

>> ...(copying files on an ST with one floppy takes lots of disk swaps)...

>True....but even a child knows that a Ramdisk (or hard disk) is an easy
>fix for this.

Oh really..? And how long have YOU been doing Atari support..?

We're all born knowing the best way to run an Atari computer..? It says so on the outside of the box, or in the manual..? The video tape that comes with the system tells you this..? How is it that "even a child" has this innate knowledge..?

It would be hard for me to estimate the number of times I've had to go through the procedure for obtaining, installing and using a Ramdisk to avoid all the needless disk swaps necessary to copy a disk with one floppy disk and an early version of TOS... (and what makes you think that an Atari owner with such a crude system will, like a child, "know that a Ramdisk (or hard disk)" will help..?

If they're lucky, they'll find a support person or system who can tell them how to do it more conveniently... otherwise they'll continue to to it the only way they know how.. by swapping the disk a thousand times.

Besides, the subject was systems which force you to swap the disk many times.. not "workarounds"...

BobR

590. Laughable question duckers!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-02-28 09:48:48 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950228013437.26480B-100000@PEAK.ORG>
Source record: 13440

It's funny that we all make a bunch of posts in response to these clowns who feel the need to enter comp.sys.atari and force THEIR platforms on us, yet the replies we get are nearly all nonsense.

Make a point awaiting a reply, and the next message is just more "buy Macintosh" propoganda. You can't even reason with some of these folks!!

We get messages like "not many" as a response to the legitimate question of how many Falcons were sold. That's real useful information, Peter. Thanks!!

WE'RE STILL WAITING TO HEAR HOW MUCH A MACINTOSH FLOPPY DRIVE COSTS. Sure, perhaps the argument is a bit silly, but everybody has been in it up to this point. I posted that a 1.44Mb standard drive (with eject button) can be had for $45 all over the country. The other side just ducked the question of how much is their drive. Probably because (1) THey're just too lazy to find out (2) They know it'll cost a bundle [they probably figure it's waaaaay expensive, so #2 and #1 sort of combine, (3) They want us all to forget it and let it all blow over....but only when THEY choose to do so...

HA HA HA HA!!!!! I hope these clowns aren't representative of the REAL users of Macs and PCs.... If so, it doesn't speak well for SOCIETY, since those machines are so prevalent.

Who are we arguing with here? I strongly suspect that anyone who devotes his efforts to imposing his viewpoints of X platform on Atari users, is merely someone who has little in this life to pride himself on. This person probably has never achieved anything in life, and has nothing to make him feel good about himself.

So, he got out of Atari and got whatever platform he believes serves him better (nothing wrong with that, mind you) but comes BACK to the comp.sys.atari, and somehow thinks that his new computer makes him better. He thinks that now, he's superior, and has something to boast about. Instead of Mac and PC users should pick on someone their own size - each other. It's much easier to come into a newsgroup of older computers (like Atari) and try to be a Macho Man with your new Super-Duper computer. In addition (as pointed out previously), these clowns can "reinforce" their decision to get out of Atari, by trashing the machines and flaming them constantly.

I THINK THESE PEOPLE SHOULD GO ENJOY THEIR NEW COMPUTERS SOMEWHERE ELSE!!! WE KNOW WHAT IS AVAILABLE, AND WE ENJOY USING OUR ATARIS!!!! ATARI - "LOVE IT OR LEAVE IT." I wish that applied to comp.sys.atari too....but somehow the warped minds of those other guys just like to

linger here and try to feel superior.

James

>or the Timex Sinclair 1000, for that matter....so what?

So if someone advocates the use of a Sinclair 1000 as being faster than the
PC, why not give him the figures ?

>Playing DOOM is not really what *I* would consider to be criteria for
>computer purchase. If I wanted to play Doom really bad, I'd buy a home
>video game system that plays it.

You obviously didn't have the opportunity of comparing PC Doom to Jag Doom.
Jag Doom sucks bad if compared to PC Doom: The further you get, the more the
levels are cut down to fit in the cartridge, in most cases eliminating the
flavor of them in the process. No Cyberdemon. No Spiderdemon. No music during
gameplay. No way to add new levels by getting WAD files. I realize these
things had to be done to make the game fit in the cartridge and id has made
a good effort. The Sega 32X version seems to be a lot worse. Maybe the Ultra64
version will be better.

>I'll admit that I've spent seveal hours

Bull. IBM and Compaq are the two largest PC manufacturers. They
HAVE to be doing something right. And I would propose you would be STUPID
not to buy a high-end system from a big company, with a reputation AND a
customer service department.

BTW: You CAN buy a PPC system for less than $1600 with monitor, 8
megs and 250meg hd. From the worlds largest manufacturer of personal
computers.

No. Compare it with top tier clones. Apple has been going head to
head with Compaq for the top slot, and spends as much as IBM on R&D. To
compare the PowerMacs to systems that spend litle or nothing on support
or R&D is foolish. Apple's market share and product quality is comparable
with Compaq, Dell, Packard-Bell and IBM. Therefore compare the best with
the best.

James,
I try to be civil although there have been times when I've lashed out at Sinclair :-). I just thought that maybe Sinclair would answer to a simple question. I am truly interested in whether or not he's seen a newer TOS. If not, on what authority does he make statements as to System 7's superiority? Odds are, though, that he'll whine about not having access to an Atari (as if this has something to do with Newdesk's ease-of-use, features, etc).
BTW, James, I was glad to see that you're happy with your ST. What system are you using?

Oh well, forget it. This machine never hit the market.
The machines that _did_ were ST, Mega ST, STE, Mega STE (in that order,
all 68000), TT, Falcon (in that order, both 68030) and - in rare numbers -
the ATW.

Have you ever considered visiting a pshrink to cure your Microsoftly
tunneled eyesight?

There are more OSes available for the PPC, out of which IBM's Workplace OS
(or however they'll call it when it hits the market) is the most
interesting yet. And surely, the vast improvement in processor power will
drag further people to write or port OSes to these machines.

I buy my software from MacWarehouse. MacWarehouse mails out their monthly
catalogs which is considered a bible, a must have..
My local Software Etc. has a nice Mac section and somewhat decent prices..I
guess that has do with the Local Wal-mart sales of Performas.

Distribution:

: Macintosh??? I can understand someone choosing Macintosh...but to trash
: the Jaguar...promoting the Super NES???? Come on....I don't have a
: Jaguar (yet), and I agree that there isn't much support, but I don't see
: how ANYONE could trash the Jag hardware. That is, unless there's some
: powerful emotion at hand.

There actually is a fair bit of support for the Jag, though Peter
refuses to acknowledge it. Peter once said that he doesn't dislike the
Jag on a technical sense, but has since taken to saying "The math has
been done, the Jag is not 64 bit." Very inconsistant fellow.

: So tell us, Peter, what did Atari do to "break your heart" and stir up
: such strong emotion?

He feels gyped because Atari didn't support the 7800 and Lynx the
way he felt they were supported. While Atari did make numerous mistakes
(I have both machines), they were also plagued by factors they couldn't
control ... such as Nintendo's monopoly tactics. Personally, at the
prices 7800 and Lynx games are going for these days, I don't mind at all
because I'm getting a hell of a bargain.

No.... I read your text just fine. Perhaps you didn't word things as
accurately as you intended. I'll get to that a few lines down.
In the meantime, graze on the thought that you really do need to improve
your writing skills.

>

Sorry Bob.... I shouldn't have put that "hell" in there. It made my
message seem unduly harsh! Now to the point....

Bob>The equivalent to popping the disk and switching off an ST would be to
Bob>jump out at the curb leaving the door open and the engine running.

That's what you said. I disagree. The equivalent to popping the disk
and switching off a ****PC**** NOT an ST would be like "jumping out at
the curb...engine running." Since the ST is a "simple" machine (as you
state), popping the disk/turning off is FINE WELLL GREAT!!

Now, if popping the disk/turning off is FINE WILL GREAT on an ST, then,
as you say where I've quoted you, how can this be like jumping
out/leaving engine running? The equivalent to popping a disk/turning off
on the ST would be to park the car normally, turn it off, and get out.
This is the "normal" way to turn off the ST (can't really do it any wrong
way) or park the car.

>
> You want to pop the disk and hit the power switch ON YOUR ST, fine.. that
> works just great. More complex systems need different procedures. You don't
> like that, fine... don't use complex systems.

That's why I'm in comp.sys.atari...with my "simple" system. However, I
understand what you're saying. I think it sucks to have to do an
"orderly" shutdown. "Complex" systems will probably improve to make the
wait less. On a slow PC system with WindoZe (which means anythign less
than a Pentium/PCI), you have to uncover the Program Manager and "close"
it to exit. The hard drive grinds for a moment and there's a pause.
Granted, it's not a long wait...but it irritates me a little. I've
forgotten and slammed the power switch off without ill results.

Want to make a proper analogy? Performing an "orderly" shutdown is kind
of like having to run a program to park the heads on a hard drive in the
old days. Eventually (thank God) hard drives became autoparking. Let's
hope they do the same for shutdowns, eh?

>

>

> Oh really..? And how long have YOU been doing Atari support..?

Well....I must have been 15 when I downloaded my first ST Ramdisk...for
free. Atari support? I help out as many Atari users as I can....have
since I've owned an Atari. I'm certainly no expert....but (back when I
knew other Atari owners personally) I could help 'em out.

>
> We're all born knowing the best way to run an Atari computer..? It says so
> on the outside of the box, or in the manual..? The video tape that comes
> with the system tells you this..? How is it that "even a child" has this
> innate knowledge..?

Well....I was a child when I got the ST. I had the knowledge. I guess
it's because I had common sense. Perhaps I should have rephrased it to
indicate common sense. I was a child with common sense, so I can't
really say which was to attribute my ability to <grin>.

Are we all born knowing the best way to edit a CONFIG.SYS, AUTOEXEC.BAT,
WIN.INI, or SYS.INI file? As a PC user, DON'T EVEN ATTEMPT TO PRETEND
THE ATARI IS EQUIVALENTLY DIFFICULT TO USE. Even the most ardent PC
users will concede that to a novice, a PC can be a bear at times.

> It would be hard for me to estimate the number of times I've had to go through

> early version of TOS... (and what makes you think that an Atari owner with
> such a crude system will, like a child, "know that a Ramdisk (or hard disk)"
> will help..?

It would be harder for me to estimate the number of times I've had to go
through the procedure of PC memory juggling...editing CONFIG.SYS and
AUTOEXEC.BAT. I'd have to make a boot disk for games that use
EMS...while others wanted XMS.... I suppose whatever forces allowed me
to figure out how to do that with a PC (I did) are what allowed me to
figure out what a RAMdisk is, and how to use it. However, the RAMdisk is
infinitely simpler to use than PC memory juggling. I would say that use
of a Ramdisk (on an ST, anyway) lies within the realm of common sense,
while PC memory juggling stretches common sense to its max...perhaps beyond.

>
> If they're lucky, they'll find a support person or system who can tell them
> how to do it more conveniently... otherwise they'll continue to to it the
> only way they know how.. by swapping the disk a thousand times.

Same can be said for the memory juggling PC user. If they're lucky,
maybe all their device drivers will be compatible....and maybe they can
avoid "out of memory" errors when the application calls for 640K and they
have 8 or 16 MEGABYTES of RAM....but maybe not.

Anybody who can't use an ST RAMdisk certainly should not expect to have
the good sense to run a PC and leap all the caveats.
>

> Besides, the subject was systems which force you to swap the disk many times..
> not "workarounds"...

The subject was systems that force you to swap disks many times and not
"workarounds?" Get real!! "workarounds" = solution. (RAMdisk)
swap-disk-many-times = problem

I hereby submit to you that "workarounds" as you call them, ARE within
the subject because they share a problem-solution relationship with the
subject. But you'd rather fire a round and attempt to redefine the scope
of the discussion to head off a rebutle, eh?

>...such as Nintendo's monopoly tactics.

Umm.. Atari Corp sued Nintendo for "unfair marketing practices" and was thrown out of court... apparently the court didn't agree.

Of course Nintendo DOES play unfairly...

They manufacture enough units of their products to fill demand, they actually distribute those products widely, and WORST OF ALL..! They actually presume to ADVERTISE their stuff..! How awful...

>WE'RE STILL WAITING TO HEAR HOW MUCH A MACINTOSH FLOPPY DRIVE COSTS.

Er... you seem to be the only one who cares...

I'm still waiting to hear how much a bumper for an '86 Pontiac Sunbird costs, but I doubt anyone else here much cares about that either.

The cost of a Macintosh drive has nothing at all to do with anything that was discussed... of course it costs more than a PC drive. In addition to that HATED eject mechanism, it's also a SCSI drive, which always costs more.

So what..?

By the way.. HOW MUCH DOES AN EXTERNAL FLOPPY DRIVE FOR A FALCON COST..??

(Here's a hint.. you have to use a SCSI drive on a Falcon)

Does that have anything to do with the discussion..?

>than head off a rebutle, eh?

Is that what you call it..? Interesting term for simply trying to confuse an issue...

Let's try that one again..

1). Someone said they don't like it how the Mac makes them reinsert the same disk three times if they accidentally put the wrong disk in (operator error..?)

2). I said that's no worse than copying a disk on an ST with one floppy.

3). You said that even a child knows to use a Ramdisk.

3 has nothing much to do with 1 or 2, in this context.

(Incidentally, it's wonderful that you were born with the innate knowledge that there ARE such things as Ramdisks, and where to get them, and how to use them, so that at the age of 15 you could put that inborn knowledge into useful action to help you copy disks on an ST... I still maintain that a novice Atari owner would have no clue.)

BobR

Nor does the whole range of hideous PC configuration files that plague the world.

>Probably not.
>

There's a similar discussion going on over in c.s.a.st. Anyway, there's
a lot more uses for a microprocessor than a computer. One of the
advantages of CISC over RISC is executable code size. In embedded systems
(i.e. systems running ROM and RAM only, with no external source of code such
as a hard disk or CDROM), ROM and RAM space are at a premium. Therefore,
CISCs (such as the 040 and 060) are great for these kind of things.

For instance, an 040 block move takes just one op code, yet you would
have to use loop in RISC code, which would be at least five
op codes (one to initialize a register, one to do the compare, one to do
the move, one to decrement the register, and one to jump back to the top of
the loop).

: Of course Nintendo DOES play unfairly...

No. The jury was hung on several points regarding monopolization.
While several of Atari's claims were dismissed, several were not.
Nintendo agreed to cover their own court costs if Atari agreed not to
appeal. Nintendo's practices are something I'm well versed in. Trust me.

It's also a fact that you carefully avoided the subject of my paragraph
and made up a "reply" on a different topic instead. Due to the fact that
ROM contents can be copied to RAM, Ataris can - of course - be upgraded
though disk. Due to the fact that Mac ROMs are larger than Atari ROMs,
it's _not_ easier to upgrade when it comes to these.

Atari didn't violate racketeering laws or attempt to monopolize
the market illegally.

: Wal-Mart has Sega products as well as Nintendo's one.

Lawsuits and investigations by the US trade department and
various toy stores helped this situation. Still, I was speaking to one
distributor in Toronto this weekend who says Nintendo offers extra
credits to distributors who don't carry any Sega products. This is
semi-illegal, but hard to prove, so Nintendo gets away with it.

: who feel the need to enter comp.sys.atari and force THEIR platforms on
: us, yet the replies we get are nearly all nonsense.

Oh boy, more generalizations. Please avoid them, eh?

First, I personally have NEVER "forced" my chosen platform on anyone else. My stance is, as it has always been, that if your chosen platform is and does for you what you want it to do, then that's the platform you should use.
Furthermore, the extent of almost all of my postings here are essentially clarifications of false or misleading statements that have been made about the Mac. When someone DOES ask me a question, I make every attempt to answer it clearly and civilly (civily? whatever).

: Make a point awaiting a reply, and the next message is just more "buy
: Macintosh" propoganda. You can't even reason with some of these folks!!

Especially the ones that make sweeping generalizations. Don't you agree?

: We get messages like "not many" as a response to the legitimate question
: of how many Falcons were sold. That's real useful information, Peter.
: Thanks!!

Oh, come on. Not everyone has access to solid numbers. However, if someone were to ask me "how many Falcons did Atari sell?" I would probably respond with a similar answer: "Not many." To most people who aren't so anally retentive that they need exact numbers, that answer is sufficient. "Not many", to me, easily means "not enough to make a difference," "not enough for anyone to notice," or "not enough to make a significant impact." All of these would be correct.

: WE'RE STILL WAITING TO HEAR HOW MUCH A MACINTOSH FLOPPY DRIVE COSTS.

Older drives are about $150, newer drives are about half that. HAPPY NOW? Lose the caps, please. It makes you look obnoxious.

: Sure, perhaps the argument is a bit silly, but everybody has been in it
: up to this point. I posted that a 1.44Mb standard drive (with eject
: button) can be had for $45 all over the country. The other side just
: ducked the question of how much is their drive. Probably because (1)
: THey're just too lazy to find out (2) They know it'll cost a bundle [they
: probably figure it's waaaaay expensive, so #2 and #1 sort of combine, (3)
: They want us all to forget it and let it all blow over....but only when
: THEY choose to do so...

"THEY", eh? Gotta love these sweeping generalizations. Tell me, how would you like it if someone came out of the blue and said something like, "all of you Atari loves are jerks 'cause you're using a computer that's dead and worthless and you all suck HAHAHAHAHA!!!"? Same effect.

But to get back on topic...Yes, the Mac floppy drive is more expensive. Why? Several reasons. ONE: Sony owns the patent to the "auto-inject, auto-eject" floppy drive. Apple must pay a premium for those drives, and that cost gets passed along to the consumer. Newer floppy drives cost significantly less than that because they lack the "auto-inject" function of the older drives. Apple got tired of paying Sony the premium, so they opened up bids for other drives. Several companies came up with auto-eject drives that lack the auto-inject feature, yet cost less. So Apple used them.
The concept for using this sort of drive is simple: The Mac is perceived and marketed as a high-end, premium machine. This is nourished by a number of "premium" built-in items that are almost always extra-cost items on other machines (i.e., stereo sound output, networking, SCSI support, and, of course, the floppy drive). If this is still a source of amusement for you, know that Apple will be abandoning the auto-eject floppy drive within the next year *as standard equipment*. This means that, yes, future Macs will come standard with an eject button, but the auto-eject drive will be available as a costed option, currently projected to add about $40 to the cost of the machine. This will, of course, result in the cost of a Mac floppy drive to drop to about $30-$45, which is, if memory serves, about how much a standard PC-type drive costs.
Did I duck anything?

: HA HA HA HA!!!!! I hope these clowns aren't representative of the REAL
^^^^^^^^^^^^^^^^
Well, I guess I wasn't that far off on my projection up there...

: users of Macs and PCs.... If so, it doesn't speak well for SOCIETY,
: since those machines are so prevalent.

Ah, so "all those Mac users" are now bottled into "these clowns". I wish you would specify these things in advance rather than spew all those vague generalities.

: Who are we arguing with here? I strongly suspect that anyone who devotes
: his efforts to imposing his viewpoints of X platform on Atari users, is
: merely someone who has little in this life to pride himself on. This
: person probably has never achieved anything in life, and has nothing to
: make him feel good about himself.

You've researched this thoroughly, have you?

: So, he got out of Atari and got whatever platform he believes serves him
: better (nothing wrong with that, mind you) but comes BACK to the
: comp.sys.atari, and somehow thinks that his new computer makes him
: better. He thinks that now, he's superior, and has something to boast
: about. Instead of Mac and PC users should pick on someone their own size

Newsflash, bub: I follow this newsgroup for two reasons:
ONE: To play "Devil's Advocate" by providing accurate information to
dispute false claims laid about the Mac.
TWO: To try to learn about any little details about my Ataris that may
help me. Despite your obviously well-researched notions, I haven't
abandoned my Atari. It's stimply taken a far-back seat.

: - each other. It's much easier to come into a newsgroup of older
: computers (like Atari) and try to be a Macho Man with your new

More news: Apple Computer is older than Atari Corp. The Apple //'s were
around before the Atari 400/800. The Mac was around before the ST.

: Super-Duper computer. In addition (as pointed out previously), these
: clowns can "reinforce" their decision to get out of Atari, by trashing
: the machines and flaming them constantly.

Sort of like making sweeping generalizations that categorize a whole
LARGE group of people based on a few scattered instances?

: I THINK THESE PEOPLE SHOULD GO ENJOY THEIR NEW COMPUTERS SOMEWHERE
: ELSE!!! WE KNOW WHAT IS AVAILABLE, AND WE ENJOY USING OUR ATARIS!!!!

Good for you. Lose the caps.

: ATARI - "LOVE IT OR LEAVE IT." I wish that applied to comp.sys.atari
: too....but somehow the warped minds of those other guys just like to
: linger here and try to feel superior.

I strongly hesitated in posting this follow-up as, about halfway through,
I realized how pointless it's going to be to try to make you realize how
making so many huge, sweeping generalizations makes you look like an
uninformed twit. If you care to *DISCUSS* the issues *SPECIFICALLY*, then
I'm willing. If you insist on continuing with phrases and words like
"everyone", "all those Mac users", "they all" or "all of 'em", then
you'll not be worth talking to.

ARE YOU TRYING TO SAY THAT THE MAC HAS MORE SOFTWARE THAN THE PC? Come on, now - I thought everyone should know better. I don't know what a Mac Product Directory is, but I do know that you left out DOS (!!!) in your above paragraph. Perhaps there is more Mac SW than OS/2, or perhaps Windows (doubt it, though)....but certainly not more than DOS+Windows+OS/2 - all of whic are PC sw.

James

Good way to duck out of it, slick. Just forget it. I do seem to be the only one who cares, because I'm the only one fool enough to enter a debate with you....who ducks questions and who specializes in pointless flamebait. Want proof that you're just here for flamebait? What are you doing in comp.sys.atari, throwing your views of other platforms on us?

> I'm still waiting to hear how much a bumper for an '86 Pontiac Sunbird costs,
> but I doubt anyone else here much cares about that either.

That's a really brilliant statement. Bravo! My hat is off to you for your masterful debate form (BARF!!!!!) I'd just haul that P.O.S. to the junkyard...no need to get a bumper. I take it your ineptitude prevents you from seeing the relevance of the price of the Mac drive? In the thread, it came up that it was a "needless feature." Like all features, even needless ones have a cost. The cost for a needless feature is a disadvantage. However, you're apparently not smart enough to understand the concept, or too arrogant to admit if you do, and you're obviously incapable of reasoning and debate, so just drop it, ok?

>
> The cost of a Macintosh drive has nothing at all to do with anything that was

> So what..?

Ha ha! I almost spilled my tea reading that nonsense. Re-read my above paragraph, then drop it.

>
> By the way.. HOW MUCH DOES AN EXTERNAL FLOPPY DRIVE FOR A FALCON COST..??

I don't know, nor do I care. The comparison was between a standard 1.44Mb floppy mechanism (like what I have hooked up to my 8-bit Atari via the CSS Black Box/Floppy Board). Standard mechanism. I don't know what the Falcon uses because I don't have one.

>
> (Here's a hint.. you have to use a SCSI drive on a Falcon)
>
> Does that have anything to do with the discussion..?

Nope....it sure doesn't. However, you are adept at posting things that have nothing to do with the discussion (Falcon drives, for example), and equally skillful at evading that which IS relevant to the debate (the cost of a Mac 1.44 drive). After establishing that the "no eject buttn" was a needless feature, the goal was to find out how much this needless feature cost. The price benchmark was a standard $45 Teac 1.44 drive, and the next logical step was to find out the price of the Mac 1.44. Instead of doing this, you dodged the task, were not capable of understanding HOW the Mac 1.44 price could be relevant, and then introduced irrelevancies (the Falcon lies beyond the scope of a discussion between a standard 1.44 and a Mac 1.44). I therefore conclude that debating with you is a WASTE OF TIME and I won't do it anymore. I'll only reply to your messages telling you that debating with you is a waste of time.

Source record: 13461

.....if I was anyone disturbed by their messages. They are simply here to Atari bash and flamebait.

From what I gather, they both *USED* to use Ataris as their primary computers. Now, they use other platforms and feel that their new choice is superior. They are entitled to that decision (as is anybod), and I am sure that their new systems are powerful and serve them better than their Ataris.

This brings up the question: WHY ARE THEY STILL IN COMP.SYS.ATARI?? All they do is Atari bash, and put down Atari hardware, and Atari Corp. You've all seen it. Some of their criticisms are legitimate - any Atari user is aware of the shortcomings of the computer and the company. However, the criticisms they voice are nothing new to anybody.

I strongly suspect that they feel some testoterone-driven impulse to come back to this group and boast about their new hardware. Perhaps they think that we (Atari users) just don't know how "great" their new systems are. They feel it's their duty to play teacher and inform us. Perhaps they feel they are smarter for using their machine. That makes them feel better. Perhaps because their new machines are faster than an Atari, they somehow attribute that to THEMSELVES, and feel like they are more of a person now. Most of all, perhaps they are just "do-nothing" sort of guys who never accomplished anything in life, and therefore have nothing to make them feel good about themselves. So, they come back into Atari forums to boast of their new hardware, bash Atari, and get high on some false illusion of grandeur.

Every time I replied to one of their posts, I wondered, "What are these guys still doing here?" Nevertheless, we entered debate. Debates can be entertaining and informative; I'm not afraid to admit that I've been proven wrong before, and I'll sure admit that when I lost, I emerged smarter, so I still gained. Debating builds critical thinking skills. It's great...if your debate partner is capable of reasoning and critical thiking himself/herself.

However, Bob and Peter are NOT WORTH YOUR TIME. Proof? I've posted on many occasions asking them what they are doing in the Atari forum, if not to illogically (and perpetually) Atari bash and flamebait. I'll give them both a chance to prove me wrong in this matter; things can't get any simpler than this:

BOBR: WHAT ARE YOU DOING IN COMP.SYS.ATARI? WHY DO YOU COME HERE IF YOU ONLY WANT TO ATARI BASH AND FLAMEBAIT?

PETER: WHAT ARE YOU DOING IN COMP.SYS.ATARI? WHY DO YOU COME HERE IF YOU ONLY WANT TO ATARI BASH AND FLAMEBAIT?

Well folks, let's see if they dodge this one. If so, then I've proven my point. If they answer those questions, then perhaps I was wrong. However, to my credit, they've never commented when I posted these things before.

Some of my favorite examples of them:

1) Peter comparing the Falcon 030 (which is now an old design) with a new PowerMac, and feels it necessary to pronounce the Power Mac the victor. (Why doesn't he pick on a Timex Sinclair 1000 or Vic 20, while he's at it?)

2) BOBR comparing a 1040ST(e) against a new PC (probably a 486, clock doubled), and finding it "orders of magnitude" faster. (As if the Atari somehow failed in its duties to whip a 486/66.)

3) Peter, responding to the question of how many Falcons have been sold. Some guy just wanted a legitimate estimate, which is usefull information. Peter responded "not many" - which is his useless opinion, and was intended as flamebait only.

4) BOBR: In debating the "no eject button" floppy drive on a Mac, we finally reached the point of considering the "no eject button" to be a needless feature that does not detract from the Mac or render it a piece of s***. Agreed. However, needless features cost money. I reported the $45 price for an industry standard 1.44Mb mechanism (standard? you bet. I have one hooked to an 8-bit Atari!). I asked what was the price of the Mac 1.44, (if it costs more than $45, then is indeed a disadvantage). Instead of answering the question, BOBR decided that the price was irrelevant (how convenient for him to do so), and then introduced *REAL* irrelevancies by asking how much a drive for the Falcon is! The Falcon was never in the picture. The idea was to compare prices for an industry-standard 1.44 against a Mac 1.44. How relevant? If the needless feature costs, then it *is* a disadvantage. Don't expect logical reasoning from BOBR in this regard. I'LL HAVE TO ADMIT THAT THIS IS A STUPID DEBATE. The only reason I kept at it for so long was to see how much he'd dart/weave and duck. He's done so quite steadfastly. One has to wonder if he's really too stupid to see how a price comparison of the industry standard 1.44 and Mac 1.44 is in order, or if he's just pretending to be that way because he's afraid of being proven wrong.

This is the last I have to say on the subject. I will probably NOT enter a debate with these guys anymore; at least not a long one. I'm sure that I will probably reply to some of the outlandish things they post, but I will do my best to ignore them. I ENCOURAGE OTHER ATARI USERS TO IGNORE THESE FELLOWS, AND MAYBE THEY'LL GO AWAY AND LET US ENJOY OUR COMPUTERS IN PEACE.

James

Oh, I know Nintendo does all that nasty stuff.. (there was that silly business with the $5 coupons that was more beneficial to them than any kind of "punishment" for their trade practices, for instance...)

But somewhere along the way they also manage to market and sell their products.

I'm not saying that Atari should adopt similar practices, but I sure wish they'd figure out how to do more than just design good hardware...

That particular lawsuit was during the time Atari was dropping the ball on the Lynx, and it sort of just came off like they were whining instead of doing anything about it.

>Bad comparison. Compare the Mac Product Directory to the Windows
>or OS/2 Product directory.

>ARE YOU TRYING TO SAY THAT THE MAC HAS MORE SOFTWARE THAN THE PC?

Jeez, James... learn to read, OK..?

You're embarassing yourself and making yourself look more than a little
foolish in front of everyone.

He's talking about Windows (look up there.. see where it says "Windows"..?
That's a clue..) and OS/2 (again.. a big clue to what he's talking about is
where it says OS/2..), NOT "DOS" (a clue here is that the word "DOS" doesn't
appear in the sentence.. you should try to read only the words that are there,
and not the ones you imagine, or see in the blank spaces between the lines.
For example, the term PC doesn't appear in the sentence, so we can pretty
confidentally assume that he's not talking about the PC in general.)

Now, what the sentence means is that you should compare the Mac Directory to
the Windows directory, or compare the Mac Directory to the OS/2 directory.

There.. that wasn't too hard was it...? Try it again.. it gets easier with
practice.

Maybe I should post an article telling everyone to just ignore you since you
obviously can't read..?

>BTW, most people who run STs on a frequent basis are probably aware
>of the advantages of RAMdisks.

That's absolutely true... but that's not what I was talking about.

My point is that the owner of the *system I described* namely, an ST with only a single floppy drive, which IS the worst possible set-up, is VERY LIKELY to be an inexperienced novice user, in all likelyhood someone who just bought their brother-in-law's ST and who has NO IDEA what's going on.

These people DO exist.. I help them every day with their "new" systems. In a lot of cases they didn't get a manual or any instructions, and didn't even get a "system floppy" so they could boot up their "new" computer. The first thing I have to do is to acquaint them with the idea of an operating system in ROM, so they don't NEED a "DOS disk" to start up the computer. THESE people are NOT going to know about the RAMdisks that "even a child" knows about.

These are the people who are going to be frustrated with swapping a disk dozens of times to make a copy unless they can find someone who can TELL them what a RAMdisk is, and how to use one... they're NOT born with the knowledge, as was the implication in "even a child knows..."

(Right now we've got the interesting situation of a PC owner who came in looking for a way to transfer files to an ST, who was told by his Atari owning friend that they could NOT use the same floppy disks. Now the PC owner has to go back and convince his friend that his Atari has MORE capabilities than he thought it had... this "child" didn't know his ST had MS-DOS floppy compatibility.)

>insulting someone, are we?

Yup, I guess so... I usually try not to start anything, but I do tend to "answer in kind"...

I know, it would be better to just think "sheesh, what a moron", and skip to the next message, but sometimes it's more fun this way...

I'll try to be good... :)

: But somewhere along the way they also manage to market and sell their products.

I agree. However, part of their "marketing" includes making sure
that the consumer either 1) never sees the competition, or 2) the
competition doesn't get any software so it might as well design.

: I'm not saying that Atari should adopt similar practices, but I sure wish
: they'd figure out how to do more than just design good hardware...

They aren't doing a bad job with the Jag. I've seen lots of
commercials, their dealer support and developer support is leagues better
than it was, plus the promotions are good too. Not perfect, but not as
"100% horrid" as Peter would have us believe.

: That particular lawsuit was during the time Atari was dropping the ball on the
: Lynx, and it sort of just came off like they were whining instead of doing
: anything about it.

Actually, it was announced when the Atari 7800 was their main
machine, but it took forever to get to court. By the time the case was
heard, Nintendo had dropped the exclusitivty clause and got away.

: my first atari games - cool!
: But why for windows?

Well, let's see some possible sales projections.

Figure out how many packages Activision would sell if they released it for the Atari 680x0 series of computers, and everybody with one of those machines purchased it.

Now figure out how many packages they'd sell if they released it for the PC platform, and one third of those people bought it. Or one fourth. Or one fifth, even.

Which has the largest sales potential?

It's called "business", Vlad.

>A SCSI floppy drive? Nope, no such animal.

Really...? I guess I better go out into Computer Room #4 and tell those
DEC TA91 tape drives to stop loading their boot floppys from that little
floppy drive with the 50 pin ribbon cable on it, since there's no such animal..

>No, but neither do the nonexistant SCSI floppy drives you're talking about.

Guess I better shut down the telecom network I'm dialling out on then, since
all the Motorola 68030 VME systems have those nonexistant SCSI floppy drives
on them too... darn.. it sure SEEMED like they all booted up the last time
we reloaded the network.

But if you say so...

BobR

(Incidentally then, just how IS anyone with a Falcon going to add a second
floppy drive, since there's no external floppy connector..?)

Re: Technical refrences for the Portfolio

Probably the best source of info about what's available for the Atari Portfolio would be Don Thomas at Atari Corp.

Call them at (408) 745-2000 and ask for Don. He's heavily involved in their promotion of the Jaguar right now, but he's one of the most knowledgable people there is when it comes to the Port...

Tell him I said "Hi"...

>Exactly. So compare the Mac clones to the 2nd and 3rd tier ones. As for
>Compaq, there #1 worldwide with revenues topping $10 billion annual..

I do compare the Macs to the 2nd-tier PC clones. You obviously don't
know much about PC's, Sinclap, or you would realize that "2nd-tier"
PC's are often as good as or better than "1st-tier" ones. The 3rd
tier is mostly trash that should only be compared to other forms of
garbage.

True, Compaq is #1 with revenues, but that's because A) several major
corporations only buy from Compaq, and B) Compaq charges the highest
prices in the personal computer business. Most (normal) PC users,
however, don't buy Compaq because their machines, while generally good,
are just too expensive; and, in any case, Compaqs aren't much better
than the best of the 2nd-tier clones anyway.

I would propose that you would be STUPID not to buy a system from a 2nd-
tier cloner that is as good or better than a 1st-tier one but costs half
as much. Many 2nd-tier cloners are sizable companies with decent support
policies.

>What's a SCSI floppy?

Hmm... suddenly we seem to have hit upon a technological concept that has a lot of people baffled...

A SCSI floppy is a floppy drive that sits on the SCSI buss, has a SCSI device number assigned to it, and serves up data from a floppy disk upon command from a SCSI bus master like a Motorola MVME 147-S controller.

In the case of the AutoNet terminal interface processors I was talking about earlier, the drives are Motorola MVME 884K devices, which are 2.88 Meg floppy drives with SCSI interfaces.

Although I don't have a Falcon to test one with, I'd assume it would work just fine as an external floppy drive for a Falcon too.

That's what a SCSI floppy is...

*+=->to comp.sys.atari TO ATARI BASH. Go figure.

James, you seem to have completely lost it...

If you can't handle the concept that someone thinks PCs aren't as hard to use as you seem to find them, fine... but how you come to the conclusion that equates to "Atari bashing" is a little bit of a stretch.

Why not go take a nice pleasant walk around the block, breath deeply for a while, maybe go see a movie or something..?

>discussion.

It does have to do with it. An ordinary Shugart HD disk drive costs about
70,- DMs and I can get one _everywhere_. What does the Mac drive cost?

Well, then, have you considered enhancing an Atari with some neat desktop
replacement, such as no|desk or Gemini? Have you even _seen_ one of these?
You can now try them on any 68030/040 Mac after running MagiCMac first.

>
>My point is that for me, and for probably 90% of Atari computer owners, the
>MIDI ports and the VME slot are "useless things".

I'd say that for 90% of the Atari users the MIDI ports has been the reason
to buy it in the first place. And those who have bought a TT or a Mega STe
the VME-slot is an important feature, there are some excellent video and
graphics cards for VME (did you know that by using 4 Matrix cards in one
VME-slot gives you ability to run 4 different realtime digitized videos
inside Calamus SL's frames for grabbing images?). Try that one one
PCI-slot. And by using a VME graphics card you have a true 64 bit graphics
bus - and it's really fast (I just saw a NOVA on my friends TT).

But of course, in England Atari-usage is a few years behind of the rest
of the Europe (eg. take a look what kind of applications are reviewed in
ST-Format) :-(It seems that ST-low is still the favourite resolution
in England, and Breakthru is considered a high-class MIDI application.
Sad.

With Atari you just load the application again and continue working.
With a Mac, you'll start the Application, and wait for 10 minutes
when the program fixes lost swap-files etc (this is a real example
from Filemaker Pro). And there's always al sorts of scrap-files
left from different programs (also in Windows).

The Falcon uses a standard HD (or ED) Shugart FDD internally. Exte5rnally,
you'll need - a power supply unit
- a case
- a cable
and, as the Falcon is only intended for single FDD use
- some tiny logic unit switching FD0/FD1 if needed (cheap).

>> (Here's a hint.. you have to use a SCSI drive on a Falcon)

Nope, you haven't. See above.

I know as much as you think. Compaq has very competitive prices backed by a
nice warranty. Compaq will be announcing new lower prices this week and once
again under cut Dell and IBM. Compaq will have 75-90 mhz Pentium systems with
prices starting under $2000...

>
> Well, then, have you considered enhancing an Atari with some neat desktop
> replacement, such as no|desk or Gemini? Have you even _seen_ one of these?
> You can now try them on any 68030/040 Mac after running MagiCMac first.

Does it matter, when Atari is out of the computer business? Next month Apple
will began introducing new price/performance putting the $1300 Falcon on the
bottom for price/performance.

The question was can you moraly advocate a ST to a new user despite the better
postures on the other platforms?

Scot's answer was yes... So I refuted him...

WHAT!! Yet another Sinclap account!!
What's going on here??

Could it be that Sinclap actually managed to get himself
kicked off netcom (not an easy task)?
Or could it be that he, regardless of the expense, wants
to ensure himself Internet access by acquiring as many
accounts as possible?
Or is he doing this as a dirty trick to everyone who has
his other accounts on their kill files?

What is the answer??
I don't know.
Your guess is as good as mine...

Are you saying that an add-in board in more PC-compatible than a genuine PC is!? I'd hope not since that makes no sense whatsoever.

In any case, a Pentium-based PC is MUCH less expensive than a PowerMac+Houdini combo. I will never buy a Mac until it has an optional command-line file interface. (GUIs are fine for most things (like spreadsheets) and nearly indispensible in others (like word processors) but in file management they're downright annoying because they hide too many important details).

The Falcon can use an external Floppy disk drive, but there is no external floppy connector as in the ST series. By connecting a SCSI floppy, and using SCSI drivers, you can get the functionality of a second floppy drive.

There was a lot of talk about this when the Falcon came out, and one of the suggestions was to use a 20 Megabyte magneto-optical drive that can read and write 1.44 Meg floppies as well as the 20 Meg MO disks.

That would certainly work, and would be ideal for making backups of the hard drive, but unfortunately costs something like $350. Purple Mountain (in Oregon, I believe) was selling complete units for this price.

Also, as Thorsten indicated, the cost for an external floppy is more than just the bare drive itself, as you need some kind of case and power supply for it, plus the cables and connectors to hook it up.

The problem of lost TMP files and other temporary storage files being damaged during a power failure (or hitting reset when the system isn't ready for it) is very common, on any computer of any complexity.

A normal ST doesn't use a swap file for virtual memory, so obviously there will never be a problem of damaged swap files. However, any ST application that creates TMP files will have the same problem of "scrap-files left from different programs" if it's interrupted before it can delete those files normally, whether it's because the power failed, or because the reset button was pressed.

Also, if power fails or the reset button is pressed when the ST is updating the FAT tables on the disk, most likely it will result in lost clusters, and possibly cross-linked clusters.

The only safe way of avoiding power failure problems is to use an uninterruptible power supply so disk access can complete, and applications can shut down before the computer dies.

On a computer without some kind of shutdown management, there is no way to protect against the reset button being pressed.

This really is getting a little silly, don't you all think..?

Thorsten uses the VME slot for a VERY EXPENSIVE upgrade to his system, and has used the MIDI ports for a data transfer medium.

That's cool.. those are two uses for the two features that *I* personally find useless.

My point here is that relatively VERY FEW owners of Atari systems DO use these ports for anything at all, thus the extra cost of adding the components for them is wasted.

Thorsten and others consider the power-eject feature of the Macintosh as being useless, and as needlessly adding cost to the computer.

At least it's something that gets used by EVERY owner of the machine, and *may* have helped save some files.

Can I definately point to how many Mac owners may have been saved at one time or another from damaging files or directories..? Of course not.. no more than anyone can tell if their surge surpressor is saving their equipment from power spikes.

But that is the intended use of the power-eject floppy drive.

If you don't like power-eject drives, and have a really deep seated loathing of them, then don't buy a Mac.

If I really, really thought the money wasted on MIDI ports and VME slots was a serious drawback, I wouldn't have bought any STs.

Oh, I definately do agree that wonderful things CAN be done with the VME slot on Mega STes, and TTs.. just as some people have used the MIDI ports for some pretty good things...

But.. I know thousands of people all over the world who own Atari computers, and the absolute number of those "average" computer owners who are using those features is VERY small.

I think the availability of the MIDI ports *may* have been an additional inducement in many peoples' minds when considering an ST, just like having "chrome reversed dipsticks" on a car may swing the sale one way or the other.. but VERY few people have actually USED the MIDI ports for anything useful.

The ST was pushed for a while as a platform for musicians, and it found very good acceptance in that niche market. It used to be fun to pull friends over to the areas in record stores where I knew the artists had used STs in the production of their music and point out in the credits the "Thanks to Atari and Dr. T's software" on the jackets... yes, that's a great use for the MIDI ports... but..

Out of the 1 or 2 million Atari computers in the world, just how many professional musicians do you think are using them..? From my observations, not many. And every one of the "Average Joes" who don't use the MIDI ports were forced to pay for them, just like the musicians who DO use them.

The reasons for buying Atari computers have included their cost/performance ratio, their ease of use, their colorful graphics, the built-in and easily used GUI.. and VERY minorly, the availability of MIDI ports that might, maybe someday, be used for a game of MIDImaze, and which for the most part will just sit there unused.

Again.. I'm not saying these are completely useless features, just that for me, and most of the people I know, they are not used for anything.

>>try popping a disk out of your Atari during a directory update, then quickly
>>stick a DIFFERENT disk in it, just as someone in a hurry might do..

>>Then try to use the second disk again..

>Where's the problem? And: who'd do this?

Ask anyone who's ever been the Disk Librarian for an Atari Users Group if
they've ever ruined a disk copy by mixing up the copy and original disks..
it happens...

Also, does the OS check for the serial number of a disk reinserted during a
directory update..? If not, the directory from the first disk will get
written on the second disk, ruining it. I know that many replacement 3.5 inch
floppy drives used to replace single sided drives had the problem of the
system not recognizing a media change, making it dangerous to be switching
disks at all without manually forcing a re-read of the directory.

>> ... emptying the Mac "trashcan"...
>Forcing you to throw away anything _twice_.

That's called a "confirmed delete". On the ST it's equivalent to being
forced to click on YES, you really want to delete the file. (Sure you can
live dangerously and turn that feature off, but having it on is a "confirmed
delete", just like having to "empty the trash" on a Mac.)

In a perfect world, everyone would do everything right and never need seat
belts or confirmed deletes to be sure they really, really wanted to delete
a file. In the "real world" a large part of the duties of the Operations
staff at work is doing file restores for people who "accidentally" deleted
files from the mainframes, even WITH a confirmed delete feature asking them
if they really, really wanted to kill the file.

The "trash can" metaphor is consistant with the rest of the Macintosh desktop,
and follows its design philosophy of trying to make the use of a computer
easier for people not used to them.

>By the way.. HOW MUCH DOES AN EXTERNAL FLOPPY DRIVE FOR A FALCON COST..??
>(Here's a hint.. you have to use a SCSI drive on a Falcon)

It is possible to hook up a standard floppy mechanism as the second floppy drive to the Falcon. The Falcon FDC allows it, although there isn't any connector, so you have to make your own one. If you do it, SCSI drives won't be necessary.

BTW: I am Falcon user and I personally think, that a second floppy drive isn't necessary at all, as long as you have a hard drive and/or the LAN-connection with another computer.

Regards.

From: paul.elliott@hrnowl.lonestar.org (Paul Elliott)
Newsgroups: fido.housysop, houston.efh.talk, houston.internet.providers,
tx.politics
Subject: (fwd) another message against S. 314

Subject: WAKE UP, NET CITIZENS!
Hello there,

Give me about two minutes of your time here for a very serious problem
that is going to affect all of us. I've spent the entire day reading
through Senate Bill 314, the so-called "Communications Decency Act of
1995", as well as hundreds of pages of reviews, commentaries, and
impact analysis. This bill is going to be attached to another
communications regulation bill which is favored by many members of the
Congress. (The entire issue should come to discussion in early March!)

Long story short, if you post anything "indecent or obscene" at any
point on the Internet or on any BBSs after this Bill passes, you could be
fined $100,000 and jailed up to two years. Furthermore, whichever service
transmits your message -- whether it is a university or a commercial
provider -- will also be fined $100,000 PER DAY that the message is
publicly accessible.

For those that don't know this, the Internet itself is comprised of
thousands of individually-owned networks all connected together. For
example, I am building my own small network with my own computers, and
will then pay Netcom about $1,000 per month to have it connected to their
network, which is in turn connected to other networks--- creating the
Internet we all use. When a message such as this one is sent out, it
travels from network to network to network until it reaches its intended
audience. UNDER S.314, EVERY PROVIDER TRANSMITTING AN OBSCENE OR INDECENT
MESSAGE IS CRIMINALLY LIABLE.

If this bill is passed, huge sections of the World Wide Web (WWW) will
shut down almost immediately. Usenet groups will be severely restricted,
because anything "indecent", annoying, or harrassing--statements like "the
Holocaust never happened" for example--could be illegal. Most Net BBSs
like ISCA or NAILS could cease to exist since live chats can't be censored.
```

American ftp sites will be strongly restricted, and access to foreign sites could be prohibited altogether. And many providers will either screen each individual message for content, or more likely, simply close up shop and leave. In the end, the Internet will be pratically worthless, compared to the vast resource it is now.

And for those of you who enjoy Internet mailing lists, these lists will almost definitely end with the passage of this bill. Why? Because after the passage of this bill, anything potentially offensive to *anyone* reading a list will hold the author or list manager criminally liable. Most mailing lists on the Net are free, and probably can't afford the risk of publishing something offensive.

I know a lot of the "petitions" going around are rather difficult to understand, and I hope this message makes things a little clearer, and make you understand why it is so important for you to ACT NOW.

"Authority has always attracted the lowest elements in the human race. All through history, mankind has been bullied by scum. Those who lord it over their fellows and toss commands in every direction and would boss the grass in the meadow about which way to bend in the wind are the most depraved kind of prostitutes. They will submit to any indignity, perform any vile act, do anything to achieve power. The worst off-sloughings of the planet are the ingredients of sovereignty. Every government is a parliament of whores.
"The trouble is, in a democracy the whores are us."

--P.J. O'Rourke,
Parliament of Whores

(1) IF YOU OR YOUR FRIENDS OPPOSE THIS BILL...
If you haven't already signed another petition floating around on the Internet now, then get as many names and addresses and email them to me at <stan@rain.org>.
Please send me:
- your name
- your email address
- whether or not you are a US citizen
(Non-US citizens may still sign!)

(2) IF YOU WANT MORE INFORMATION ABOUT S.314...
Point your Web browser at http://www.wookie.net/~slowdog/ or just write to me and ask for info. I've got the text of the bill itself, as well as stuff from PCWEEK, Newsweek, a CNN transcript of debate on the bill, and various papers of analysis. Yours for the asking.

(3) FORWARD THIS TO *EVERYONE* YOU KNOW...
Don't let the Internet go to hell while you sit by and watch. Send this message to everyone you know so that they too can know about this threat to our freedom. Chances are, they'll thank you for it. And if they find it offensive?

Well, at least that's not illegal... YET.

John Stanforth Jacobs
Editor, Moonlit Thoughts At Three A.M.

PowerMac plus Houdini(with soundblaster) is truly plug n' play. My Library has
one of the earlier Quadra 610 DOS compatible one. It was my job to unpack the
sucker and set it up. Very nice integration. The Houdini II will be even
nicer. My new boss wants to add more Macs(powerMac ones) in the library and
asked my opinion about it. He is the Head, Library Technologies and Systems
director....

Eh, ever heard of Apple Script. Your into file management... As for the
PowerMac+ Houdini board is still cheaper than a Pentium plus Powermac systems.
The Houdini board adds only $500 - $600(w/soundblaster) to the PowerMac..

In a word, yes. It does not run OS/2 or Linux yet, but all it
would take is a system mod utility.

>In any case, a Pentium-based PC is MUCH less expensive than a
>PowerMac+Houdini combo.

And what leads you to this conclusion? The Houdini card is only a
few hundred, and you can get faster solutions from Rely for even cheaper.
Two systems for the price of one, definitely more cost-effective than a
single CPU system.

I will never buy a Mac until it has an
>optional command-line file interface. (GUIs are fine for most
>things (like spreadsheets) and nearly indispensible in others
>(like word processors) but in file management they're downright

Utter bullshit. There is NOTHING a CLI can do that a GUI can't do
faster and easier. Even so, you can run Applescript and Perl on the Mac,
propelling it far in front of Unix command line shells for file
management.

I paid a visit to the local Wal-Mart in Cedar Falls, IA. today. The computer section had a
Packard Bell Pentium(60 mhz) system - PCI bus, 420 meg hd, 8 megs ram, keyboard, mouse, 16
bit sound card, 2x cdrom, 28 dpi color monitor and software bundle. The cheapest PowerMac
Performa bundle I have seen is $2300. Apple needs to reduce that bundle from $1800-$2000.

As if that wasn't enough of a public admission that Macs are too
expensive, he also posted this:

The Packard Bell Pentium system had a cost of $1869 with cdrom, monitor and software bundle. The PowerMac 6100/66 costs $1689(street) with out monitor, keyboard, cdrom and software bundle. Apple has a Performa 6100/60 bundle starting at $2300. Apple needs to drop that bundle down to $1800-$2000 for competitive reasons.

>You're not a musician, are you Bob?

Nope.. and I could count the number of ST owners I know who ARE musicians on the fingers of both hands.

Surprisingly enough, Charles F. Johnson, one of the two CodeHeads who have created much of the most innovative Atari ST software is also an accomplished musician.. he's toured with Hiroshima and Al Jarreau.. that's one..

There are one or two current members of the Atari Forums who do music professionally... that's two or three..

In addition, there may be a few more who haven't specifically mentioned it, although there are music related message topics which come up now and then, and the responses are very small in relation to the entire member base.

That's my point here.. yes there are people who use the MIDI ports, but it's no way 90% of ST owners.. it's not even likely 10%. Most people probably looked at them when they took the ST out of the box and then forgot they even existed.

It's not a really big deal... I really don't care that I had to pay for them and never use them.. the rest of the computer is good enough that I can just forget about them.

But.. to me and a "large percentage" of ST owners they're useless, just as the argument was presented that the power-eject mechanism on the Mac floppy is useless.

My answer to that is.. So What..?

All computers have features that are more or less useful to individuals. These individuals don't like the power-eject, and I have no use for MIDI ports.

>>Out of the 1 or 2 million Atari computers in the world...

>Last I heard, the ST base was at 3.5 million...

Yes.. I should have said Atari STs in the world... the last figure I'd heard for ST sales was around 2 million. There have been some "closeout" sales of STFM packages in Europe since then, and people have reported seeing them on the "Home Shopping Club", so the number of units sold is probably higher than that now.

I seriously doubt there is anywhere near that number still in use however.

One friend of mine has turned his faithful old Atari 800 into a planter.. he took the guts out and opened the memory compartment, then filled it with dirt.

Almost broke my heart...

But it makes me wonder how many are still in use, and how many are dust magnets at the bottom of closets... or planters.

It was pointed out to me that the Packard Bell is a substandard piece of sh t..
However not all Macs are expensive, The Performa 575 is down to $1499 and the
Performa 630 cdrom bundle is down to $1799. Apple will also will increase the
price/performance next month.. The Performa 6100 line is over priced because
it's the 60 mhz one and not the 66 mhz one..

Just as a point of interest, here in South Africa, in the greater Cape Town
area, we have a usergroup of around 200 registered ST users...
Of wich 160 use their MIDI ports on a regular basis... they're musos.
The number of ST users in Cape Town is however more than 200, I only know
of the *registered* ones...

At last knowledge (1994 june), the registered ST userlist for South Africa
was standing close to 3000 (something like 29xx, close enough.)

Rubbish.

For a trained typist a GUI just gets in the way. A GUI is a finished restricting tool that usually can do no more than its designer intended, requires a Graphical Interface and a real User to drive it. A command line shell is a programming language and as such can be used to access and enhance the facilites of the O/S in an indefinitely extensible fashion.

The GUI can be advantageous in accelerating the initial learning curve for certain applications especially those that are used infrequently, those where considerable validation is required in their use or those where the mouse is the primary input device.

For bashing text or other situation where the keyboard is the primary input mechanism a GUI slows you down. Moving ones hand from keyboard to mouse, using it and moving back to the keyboard involves a change of focus and significant hand movement (equivalent to a cache miss?)

I use each one as I find it appropriate. Perhaps if someone were to design a keyboard for singlehanded use then one might be tempted to make more use of a pointing device?

Source record: 13371

Sinclair,
The argument was between desktops not whether or not I feel I
can "morally" recommend an Atari system to someone (which I do).
The fact is that I have used both System 7.5 and TOS 4.04 and
I like TOS much, much better. System 7.5 is very sluggish on
an LCIII (25 Mhz 030) compared to TOS 4.04 on my Falcon. It also
takes up much more memory. TOS 4.04 looks just as nice, IMO,
and is friendlier to use.
As far as recommending the Atari line to people, why not? The ST
makes a perfect first computer for someone. It is cheap (especially
second hand), powerful enough (for most users) and plays some
great games (one area that the ST clobbers the Mac in, IMO). It is
also much easier to use as far as I am concerned. Besides, many
users are confused about the current market right now with there
being five billion Mac models out there. It is simple to buy an

ST and set it up. The perfect family computer.
Also, the Falcon and TT are decent machines for those that have
a pile of ST software that they don't want to lose. You can
argue about how cheap Mac hardware is all you want but buying
Mac software will break the bank. ST software is much cheaper.
As far as powerful systems look at the Medusa. If you want a
powerful system you can get one.
-scott tirrell

668. Mac Disk Drive

Newsgroup: comp.sys.atari.advocacy
Date: 1995-03-06 17:56:54 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <95065.125654STIRRE31@MAINE.MAINE.EDU>
Source record: 13372

I am not going to argue that the lack of an eject button makes the
Mac a horrible system. However, it has caused me grief.
Now what happens if you pop in a disk and.... the drive fails
to realize that a disk was inserted? This has happened to me
on more than one machine! You cannot do anything short of pulling
out the trusty paperclip or rebooting. So the argument is not
completely without merit. I do like having control over my disk
drive. If I insert the wrong disk I do not want to have to wait
for my computer to eject it but would rather hit the eject button,
insert the new disk and press [esc]. Much nicer, IMO.

The hand held already exists in the form of the Lynx. Now I'm pretty sure that
Atari must have some Lynx 3's in development somewhere :)

All atari has to do is get together with some teams of small software
companies, and as you suggest pay them to produce games.

Thats what Amstrad did here inthe UK about 11 years ago with the CPC. When it
was launched there was already 12 free games with it plus loads of other
software that AMSOFT sold. This meant customer NEW there was alreadt
software available.

: There will supposedly be a new "core system" priced at $159, without the
: packed in game, to be available in March.. which coincidentally is the
: expected release date of the CD-ROM addon.

Atari has to sell it at this price, otherwise the user base will not be big
enough to support the number of software developers. The only problem is
that if you price things too low, not only do you run the risk of losing money
but also you run the risk of people seeing the machine as being cheap
because its bad, hence they stay away.

What Atari have to do is keep the price at a sustainable level until
(if ever) the Jag 2 comes out. Hence hopefully there will be (like
the Sega Master System) an installed used base who may be kean to
upgrade.

VME graphics boards aren't "very expensive" any more, sorry pal. And the
second-hand market has several of them available.

Since it seems that you place an equal amount of importance on an eject button as you do with other tangible issues, such as third-party support, parent company strength and hardware evolution, all you need to do is either (a) pick up one of the forthcoming Mac clones which will likely have a "buttoned" drive, or (b) pick up one of the forthcoming Apple Macs which will likely have a "buttoned" drive as standard equipment.

Since I use floppy disks on my Mac about an average of once a week, the issue of a floppy drive button is not as critical a concern to me as it seems to be for you.

>If even Sinclap, Apple Worshipper #1, admits it, then it must be true..
>MACS ARE TOO EXPENSIVE!!
>Thank you for clearing that up Sinflop.
Yes it is true and if you read my Everybody Calm down post you will see that
I left a very good comparison for people to go and price for themselves. Of course I doubt any body has BALL's to actually do it (compare the specs I listed) because as a Mac and PC user
there is no way that anybody can claim macs are reasonably fast.
Also I am so sick of hearing MAC only people clamoring on and on about how grate the MAC is Give it rest. You are never going to convince PC people that you system is better cause they don't care.
The main reason PC people post in this area is to get you MAC only people all upset. PC people know that
the MAC's PPC chip is better than the Pentium but they also know that there machines can do cooler stuff
eg. They have MUCH MUCH better games (don' even bother disputing this fact, I use both machines and the
most graphically and most gameplay intense games are all on the PC so get over it [myst was an over glorafied
slide show]) as well as a slew of neat gadgets, graphics sub systems, sound cards, and loads of other things. They give up the mac's ease of use and P&P config
because they would rather have the affore mentioned things. So if you see PC people posting rude stuff don't even bother
trying to convince them the Mac is better, just sleep better knowing that it doesn't take houres of leaning over
in contorted positions pulling jumpers and setting base IO ports trying to get stuff to work like a Sleze-ROM drive.

I haven't personally seen the insides of a Jaguar yet, so I really don't know much about the actual component count or what the peripherial supporting circuitry looks like, but as the numbers of custom chip sets manufactured goes up, the overall cost goes down... thus allowing Atari to cut the selling price while still maintaining a profitable operation...

I know that while the original Atari 800 computer sold for over $1000 when it was first released, and the Commodore 64 was about $600, at the end of their marketable lives the 800XL was costing Atari something like $24 to manufacture, and the C64 cost Commodore around $32.

It'll probably be some time before Atari can get the cost of the Jaguar down close to the selling price of the older generation of consoles, but if nothing else, that seems to be one of their areas of expertise.

Pretty bias...System 7.5 is fine on my 33 mhz 030 Performa 550. The LC III has not been sold for awhile. As for TOS 4.4, others have said that TOS crawls at a higher color rate. Memory is not an issue. I have 10 megs and my machine still was priced below $1200.

>

As for People being confuses, is a bunch of crock. The Performa 575 and the Q630 are the only 680x0 ones left. And there are four PowerMac models for each individual market. No brainer to decide which one fits your needs.

Second hand Performa 550's can be had for $800 and are upgradeable to PowerPC. as for games, the Mac has plenty like Marathon, Wolf 3D, DOOM and so on..

> ST and set it up. The perfect family computer.

> powerful system you can get one.
> -scott tirrell

The ST line is no longer sold and supported by Atari except for Jagflop development systems. Mac Software is cheap. ClarisWorks is included with each Performas and is also priced at $129 list. You have no clue about Mac software prices. I suggest you enlighten yourself on software prices with a MacWarehouse catalog. WordPerfect 3.1 can be had for $99. WriteNow 4.0 is at $45...

As for the Medusa, why? A PowerMac 8100 or a fast Pentium is a much better price...

Nice try Scott...

How much is the Crazy Dots II card selling for these days..?

The NOVA cards were something like $999 last I heard,
and the Cyrel Sunrise card had been dropped from $1500 to
$999... have these dropped more since then..?

Unfortunately there is no "economy of scale" operating in the
Atari marketplace any more, so it's almost unfair to compare
the prices of these very small volume cards to the kinds of things
you can buy in the PC marketplace, but their price makes it awfully
hard to justify them as an upgrade when similarly powerful, or more
powerful, cards are so easily available at much cheaper prices for
other computers.

True, used hardware is a good way to economically upgrade, but
I can't remember the last time I've seen a VME based video upgrade
card offered for sale here in the Atari newsgroups, on CompuServe,
or any local BBSs.

Other than video cards made specifically for Atari computers, what
VME cards has anyone here used..?

When using NVDI, TOS certainly does not "crawl." It is much quicker
than 7.5 on a 25Mhz LCIII (what does it matter if is no longer
being produced?). As far as memory is concerned the solution to
a big, bloated OS should not be to simply buy more RAM. Most
consumers will buy their Macs from Circuit City or other large
chain stores. These Macs normally come with 4 megs of RAM. If
people are not smart enough to use a Ramdisk with their STs (as
BobR would suggest) than how are they going to know to buy more
RAM and install it? And is this a good solution? TOS is much
more efficeint and I see no big advantages of 7.5.
The games you listed were all in the same genre- 3-D shoot-em-ups.
Is that all you can think about? Besides, the Jag has these games
(except Marathon) and you flamed them then. I guess games aren't
as good unless they are running on a machine with a silly fruit
logo, huh? A little biased, wouldn't you say? How many games
make use of a joystick? I know of no Mac owners with a joystick....

I have been told that the Falcon TOS does crawl in higher resolution color like
in 256 colors. System 7.5 has features and functionality that did not exist
in prior versions below 7.0 and TOS. Of course memory and system requirements
grow as well. But this is not the issue when the hardware is available at
below Falcon prices. The standard memory for currently available desktop Macs
have standard memory configuration in the 5-8 meg range. The Performa 475 is
still currently sold but I believe is no longer manufactured has four megs as
standard which is sufficient to run ClarisWorks and other apps. Ram Doubler ,
a $49 utility puts the memory issue to rest. Ram upgrades are user
installable. Just pop the lid and install the memory sim, something you can't
do with the ST line...

You are the one who put the game issue on the burner. You stated that the ST
has better games and I countered that with the popular titles available on the
Mac. You left the impression that the Mac sucked for games which is not true.
I have a subscription to the monthly cdrom game magazine called INSIDE MAC
GAMES.. Which is pack full of demoes, shareware, public domain, reviews,
Quicktime clips and so on...

>Interface and a real User to drive it. A command line shell is a programming
>language and as such can be used to access and enhance the facilites of the O/S
>in an indefinitely extensible fashion.

No. A programming language is a programming language. You can add
a programming language utility to your interface, such as Perl or
Applescript, but otherwise, the programming functions found even on
advanced CLIs like Unix shells only exist to break even with a clear and
graphical representation of your filesystem.
And what makes you think a programming language has to be
text-oriented, hmmm? The most efficient and sophisticated programming
languages incorporate graphical elements.

>The GUI can be advantageous in accelerating the initial learning curve
for certain
>applications especially those that are used infrequently, those where considerable
>validation is required in their use or those where the mouse is the primary input
>device.

Well, a good GUI like the Macintosh does not rely on one type of
input. A mouse w/out a keyboard is as inneficient as a keyboard without a
mouse.

>For bashing text or other situation where the keyboard is the primary input
>mechanism a GUI slows you down. Moving ones hand from keyboard to mouse, using it
>and moving back to the keyboard involves a change of focus and significant hand
>movement (equivalent to a cache miss?)

Wrong again. The mouse is the fastest, most efficient and most
flexible way to select text. I find it is an invaluable tool, far more
powerful than even the complex positioning commands found in Unix text
editors. And, of course, in a graphics enviroment its worth is beyond
measure.

>I use each one as I find it appropriate. Perhaps if someone were to design a
>keyboard for singlehanded use then one might be tempted to make more use of a
>pointing device?

Or finding a pointing device to suit your needs. A keyboard with
a built-in trackball requires minimal hand repositioning (no more than if
you were to use the keypad or function keys). Some notebook models have a
small nub for pointing within the keyboard itself, the selection keys
below the space bar. Or perhaps you need a chorder, a device that allows
you to enter alphanumeric input with only one hand using a combination of
keys in a series of chords.

or the Spektrum 1 TC are selling for approx. 300-400 DMs second-hand.

>The NOVA cards were something like $999 last I heard,

The largest Nova card costs DM 2,499, that's 1,100 DMs more than the PC
board inside. To be precise, the card inside the SuperNova plus is an ATI
Graphics Pro Turbo (4 MBs).
What does an Apple NuBus card with these specifications cost?
The other ones are sold from ~600 DMs (VME, 1MB) to ~1200 DMs (VME, 2MB),
the old Nova MEGA 16M (for the MegaST series) costs ~450,- DMs.

One could say that any ST card costs approximately 1.5-1.8 times as much
as a PC card.

>and the Cyrel Sunrise card had been dropped from $1500 to
>$999... have these dropped more since then..?

The CyRel boards aren't sold in Germany, no idea.

>True, used hardware is a good way to economically upgrade, but
>I can't remember the last time I've seen a VME based video upgrade
>card offered for sale here in the Atari newsgroups, on CompuServe,
>or any local BBSs.

Well, maus.biete (the Mausnet forsale group) has some every week. Mostly
MegaVision 300s, but also Spektrums, Crazy Dots, Novas.

>Other than video cards made specifically for Atari computers, what
>VME cards has anyone here used..?

I read something about that in maus.sys.atari.hardware. Ethernet adaptors
were mentioned, AFAIK. And of course there are Rhotron with their industry
cards.

>BobR would suggest)

Umm.. excuse me...

I said people will not instinctively KNOW about RAMdisks.

Once someone TELLS them about them, then MAYBE they'll use one.

The claim was made that "Even an child knows to use a RAMdisk", which
is BS...

SCSI was one(*) of the methods used to connect 2.88 MB (XD) floppy drives to Atari machines -- I say "was" because 2.88 MB floppies haven't exactly taken the world by storm. :) If someone gave you a SCSI floppy then you could use it with your Falcon/TT/host-adapted ST.

The funny thing is, TOS will think it's a removable hard disc, not a floppy, so you won't be able to use it in DOS/TOS-compatible mode. Or has someone written a dosflopp.xfs to do this under MiNT???

Hey, with a Mac floppy could you use SCSI commands to suck discs in and spit them out? K00l.

And just imagine having TOS floppies, Mac floppies, and Minixfs floppies all mixed up in one pile. Would be like back in the 70's when every micro used a different format.

(*) The other was to double the clock on the AJAX chip.

So, several Atari GUIs implement script languages, key shortcuts,
file fetching in windows by _typing_, etc. just to make working with them
worse? Nah. It depends on what you are currently _doing_ if mouse or CLI
are faster. In case of some special kind of file manipulation, the CLI
usually wins. In case you need this method more often, writing a
scriptfile and iconifying it on the desktop is. In both cases, the CLI is
useful.

Of course, some Apple droids won't get understand this.

As far as speed is concerned, the solution to a slow, crawling OS should
not be to simply buy an acceleration program. (Read: if you can buy an
acceleration program to speed up your slow OS, I can use tricks like that
to speed up mine!)

> Most
>consumers will buy their Macs from Circuit City or other large
>chain stores. These Macs normally come with 4 megs of RAM.

There are no Macs now available to consumers which don't have at least a
25MHz 68040 (I'm not sure, but I believe the slowest Mac now available might
even be a 33MHz 68040.) I also believe -- but I'm not sure -- that these
Macs come with at least 5Mb, if not 8Mb of RAM. All Power Macs come with
at least 8Mb of RAM.

>more efficeint and I see no big advantages of 7.5.

You don't see that advantages in long filenames, a universal font system,
a universal clipboard, multitasking (careful -- MultiTOS doesn't count, since
it doesn't run on most of the Ataris out there, and by your argument, "what
does it matter if it is no longer being produced?"), a universal help system,
aliases, generally adhered-to human interface guidelines, publish and
subscribe, background printing, built-in filesharing and networking? All
of which TOS either doesn't have, or has but is extremely poorly supported?

>The games you listed were all in the same genre- 3-D shoot-em-ups.

Pete,
You have been told, huh? You wouldn't care to actually use one, would you? Anyway, for word processing, etc., why do you need 256 colors? I use it for picture viewing and manipulation and games. I run my Falcon in 16 colors almost all the time although 256 colors is decent with NVDI 3.
As far as games go I don't think I said the Mac "sucked." I did claim that the ST is better for games and I stand by that. Just plug in a $4 2600 joystick and shoot the aliens, etc. Your argument was flawed because you named three games for the Mac which showed _no_ variety. Furthermore, when two of these games came out for the Atari Jaguar, you flamed them! Should this make me think the Mac is good for games? You flamed the very games popular for the Mac.

I know I'm going to regret getting into this GUI vs. CLI stuff, but
that's the chance you've got to take when you're "jacked in", eh..?

BOTH control interfaces have their strong points, and a LOT of weak points.

My particular favorite user interface is Norton Commander on the PC...

It give you the best of BOTH worlds... window display of directories, point
and click selection, click and drag selection (although not drag and drop),
one button control of all normally used commands through Fkeys, very fast
naviagation of directory structures, AND full access to the CLI for detailed
command or option switch input...

I always cringe when I have to work with a computer that has ONLY the normal
DOS interface OR just Windows.

Sure, why not..?

My favorite editor is the Capture Buffer editor built into the ST terminal emulation program, FLASH.

I've written two complete books, help files for two different online networks and uncounted magazine articles using nothing more than the Flash editor.

It's the one biggest thing I find missing in all the PC terminal programs.

Yes, the higher resolution and color modes on the Falcon DO exhibit a very noticable slowdown...

One of the common complaints about Windows is that it updates the display more slowly than an ST does.

Unfortunately the complainers seldom realize the difference between what the two systems are being asked to do.

The ST only has to display AT MOST 16 colors (and who uses Low Resolution for anything serious anyway..? In Medium Res there are only 4 colors displayed), and the total number of pixels on the screen is relatively small... the screen memory in ANY resolution is only 32K, so certainly it can be updated fairly quickly.

By contrast Windows has to update a FAR larger memory size in the commonly used resolutions, and even bigger for the optional resolutions. Same goes for number of colors... 16 colors is the norm, with 256 or more being optional.

A more equal comparison would be an Falcon running in a high resolution mode with more colors on screen... and guess what..? The Falcon runs slower under those conditions too.

I have played around with an ST many years ago. I have not seen TOS 4.X yet
because of Atari's inept distribution. Plus Atari is out of the computer
market so that means no more versions of Tos and the hardware.

Yes, but most PC gfx cards are have their own co-pro to handle shifting
these large chunks around, and all of them have seperate RAM which
doesn't load the main bus for display. You will find that a PC card which
relies on the CPU to manipulate the screen memory (not counting VLB cards)
is much slower than a Falcon in an equivalent mode due to the limitations
of the (pretty shitty) ISA architecture.

>A more equal comparison would be an Falcon running in a high resolution mode

>BobR

See above comment - to compare like for like, compare a PC with a TT using
a Nove or Cyrel graphics card (don't stack the PC against a Matrix card as
it wouldn't be fair on the PC).

Craig.

This is utter nonsense! You have obviously never REALLY used a Unix
shell if you think that. There are some things that are real easy
to do on Unix (or DOS) that is very difficult to do on the Mac because
the Mac assumes that all users are idiots. In Unix to delete a
directory and all its subdirectories you simply type: rm -r dirname
That's it! In DOS 6.2 you can do the samem thing with deltree.
What is the direct Mac equivalent of this? NOTHING. Not that this
couldn't be implemented on the Mac GUI (it could), but the point is
that it isn't.

If you still think that graphical representations of file systems
are inherently better than text-based ones, I suggest that you
try MS WIndows! File management is Windows takes you to places
you've never beeb before, like the ninth circle of Hell. You
can't even delete or move an app without causing Windows to have
all kinds of problems!!

> And what makes you think a programming language has to be
>text-oriented, hmmm? The most efficient and sophisticated programming
>languages incorporate graphical elements.

What is this "graphical" programming language you are referring to?
Every programming language I have ever seen (and I am a Comp. Sci.
major, so I've seen a lot of them) has been text-based, including the
ones used for making GUIs (including the Mac Toolbox).

> Wrong again. The mouse is the fastest, most efficient and most

>powerful than even the complex positioning commands found in Unix text
>editors. And, of course, in a graphics enviroment its worth is beyond
>measure.

I'll have to agree with this one. Mice are much better than commands
for selecting text. (Ever use Emacs? The 'Begin Block' command in it
is accessed with Ctrl-Shift-2 (ugh!)).

Small point - GEM has had a clipboard since it's creation, and most modern
programs use it....

>it doesn't run on most of the Ataris out there, and by your argument, "what

MultiTOS runs on all Atari's, but who would want to? The multitasking kernal
MiNT runs very well on all Atari's as well (in fact it was ported to the Mac
as a replacement for the inefficient Mac OS), and it is the MiNT kernal which
provides the long filenames, BSD compatible networking, POSIX compliance, etc.
It is even possible to run X11R5 on a standard 68000 based ST (as long as
you have 4Meg of RAM).

>does it matter if it is no longer being produced?"), a universal help system,
>aliases, generally adhered-to human interface guidelines, publish and
>subscribe, background printing, built-in filesharing and networking? All

The Mac OS networking is, to be honest, nothing to get excited about - it is
slow & unwieldy. You get comparable performance from using a Midi ring network
on an Atari (which is NOT a good solution). The networking support in MiNT is
light years ahead of the Mac's in terms of raw speed & power. Any Unix networking
software will run under MiNT, including NFS, Gopher, X (with remote clients),
WWW (I use Chimera compiled from the Unix sources), Ftp......

I can mount my unix account onto my Falcon, and then it is transparently available
as if it was on my local HD. Mac OS doesn't provide this level of network
integration (unless all the machines you want to connect to are also Mac's,
and even then the net is laughably slow).

>of which TOS either doesn't have, or has but is extremely poorly supported?

???? Support for the MiNT networking subsystem is one of the most active
areas of Atari computing at the moment.

>All that proves is that you don't know many Mac users. I have a joystick
>on my desk, right in front of me...

Bet you cann't use it without a help bubble to tell you what it is & an
alert box to tell you you're allowed to push Up now (check with the help
bubble to see what Up is...) ;)

Wake up bucko...it's as easy as dragging a folder to the trash...and I can do that a lot faster than you can type "rm -r dirname". It's painfully obvious that you have never spent enough time using a Mac to speak intelligently about them.

If this is the best that Rutgers can do for it's CS majors, I'm worried.

Source record: 13416

In article <D56sFt.Jqu@ecf.toronto.edu>, pischke@ecf.toronto.edu (PISCHKE DAVID) writes:
%
% You don't see that advantages in long filenames,
got them: use minixFS. I use minixFS all the time.

% a universal font system,
got that: use GDOS. Any program that requires GDOS comes with it.

% a universal clipboard,
got that: the GEM clipboard is used by loads of programs now.

% multitasking (careful -- MultiTOS doesn't count, since
% it doesn't run on most of the Ataris out there, and by your argument, "what
% does it matter if it is no longer being produced?"),
got that: MultiTOS. And it runs on anything from the lowest 520ST up
to the highest Medusa. Now if you mean there aren't many people using
it, that's different. That means they don't feel the need to run it.

% a universal help system,
Got that: Called STguide. Full hypertext help system.

% aliases,
Got those: They're in any replacement desktop, and in the basic desktop
on newer machines.

% generally adhered-to human interface guidelines,
Well, we have the guidelines. Newer programs use them. Older programs
still don't unfortunately. I'll agree that the Mac is better here.

% publish and subscribe,
No. Haven't got those. We can call external programs, but no-one
appears to do it... :-(

% background printing,
This is plain silly. Any computer can do backgrund printing. Even my
old XL did that...

% built-in filesharing and networking?
Got that. Got a full TCP/ip networking stack using SLIP,PLIP.PPP, or
ethernet.

Now: can the Mac load in external filesystems at will ? Can it enable
device drivers at will ? Is the source code for the OS freely
available for anyone to improve ? (Atari = clearing house). How
much free s/w is there available - has GNU relented yet? How easy is
it to get alternate windowing systems (Xwindows, Mgr) up and running ?
Any improvements on proper (dynamic) memory management yet ?

The Atari's OS is basically Unix, as long as you're running MultiTOS.
I know most people don't. That's not because they're stupid, it's
because they don't need to. The nice thing that it gives you is the
huge amount of free high quality software for X and Unix.

MiNT/MultiTOS comes to ~200k when you are fully loaded with devices
(ethernet etc). When I'm running X & fvwm I have approx 1.5Mb left -
about the same as when I'm running under GEM, given the extras I
load into GEM. It's rather amazing to get X into such a small space
but it works, and rather well too.

An example of how this is useful is to consider that there are no
graphical WWW browsers available yet for the ST market, so I boot X
and suddenly I have all the freely available Xwindows s/w to choose
from - so I can happily use Chimera...

ATB,
Simon.
(Who likes his Falcon, but looks wistfully at portable Pentium colour
machines, thinking: what would Linux/X be like on THAT?)

Networking on the Atari may be Unix(ish), while this is good in terms of power it is NOT good in terms of user friendliness. What we should have is 'plug in and play' networking, so that small business can easy and with the minimum of fus have a small and easily run network up and ready to go as quickly as possible. The last thing any business wants is something they have to spend months fiddling around with.

Partially true. GEM has had a clipboard, but the protocol for using it
wasn't set down by Atari until around 1992. When I moved to my Mac, about
18 months ago, most programs still did not use the clipboard -- at least not
all in ways compatible with each other.

>MultiTOS runs on all Atari's, but who would want to? The multitasking kernal
>MiNT runs very well on all Atari's as well (in fact it was ported to the Mac

I remember when MultiTOS was first announced there was a big stink from ST
users, because Atari said that MultiTOS would not run on 68000 machines.
Has this changed?

>The Mac OS networking is, to be honest, nothing to get excited about - it is

>WWW (I use Chimera compiled from the Unix sources), Ftp......

The Mac OS supports Localtalk, Ethernet, Token Ring and TCP/IP out of the
box. Take your pick.

>I can mount my unix account onto my Falcon, and then it is transparently available

>
>>of which TOS either doesn't have, or has but is extremely poorly supported?
>
>???? Support for the MiNT networking subsystem is one of the most active
>areas of Atari computing at the moment.

I notice that you chose to comment only on networking. You made no comments
about the other features I mentioned -- a universal font system, a universal
help system, aliases, generally adhered-to human interface guidelines, publish
and subscribe, background printing, file-sharing, and a universal clipboard.
Are you telling me that TOS has all these features, and that those which is

DOES have are supported by all programs? I can't think of a single program
which doesn't support Mac fonts, printing, clipboard, and so on.
Does *every* (I'll settle for most) Atari program support GDOS, the GEM
clipboard, Atari's interface guidlines?

>Bet you cann't use it without a help bubble to tell you what it is & an
>alert box to tell you you're allowed to push Up now (check with the help
>bubble to see what Up is...) ;)

At least it's attached to a computer that's still being sold.

You're kidding, right? You mean you don't even know that all you have to
do to delete a folder and all its contents is to drag the folder to the
trash? Last time I checked, even TOS did it this way.

Unfortunately the GEMulator doesn't work with IBM joysticks, and many Atari copy protection schemes won't work in the IBM drives either, so many ST games won't run.

The GEMulator is most useful for someone with expensive applications they don't want to replace right away.. for those, it does a really good job of emulating the ST.

Games are not one of its strong points though.

: Atari should get out of the video game market, and become a holding company
to
: collect patent money.. Atari will never recoup the investment from the
Jagflop
: fiasco. But, were dealing with 'the boys', though.

A similar situation happened here with a hard drive maker Rodime Peripherals,
after losing millions each year on its manufacturing, it eventually
went into receivership. The receiver sold off the factory and made the
company into a patent collection 'money' company. Within the year it
annouced hefty profits. Basically all they do now is collect cash and
design equipment for other companies.

Hi there!

I just got some information about the price for the "cheap" Mac
SuperDrive. It costs ~500 DMs in Germany.

And - of course - graphic cards aren't cheaper for the Mac than for the
Atari, either.

Simon Gornall <sjg@phlem.ph.kcl.ac.uk> wrote:
>% a universal font system,
>got that: use GDOS. Any program that requires GDOS comes with it.

My point is that the vast majority of programs out there do NOT use GDOS.
Even when programs do use GDOS, some of them use it in strange, incompatible
ways, or don't support the font-scaling capabilities.

>% a universal clipboard,
>got that: the GEM clipboard is used by loads of programs now.

Last time I checked, most did not. My point is that *every* Mac program
supports the Mac's font system and the Mac's clipboard. The same universality
does not exist on the Atari.

>got that: MultiTOS. And it runs on anything from the lowest 520ST up
>to the highest Medusa. Now if you mean there aren't many people using
>it, that's different. That means they don't feel the need to run it.

You must be kidding. I can run MultiTOS on a 520ST??

>% a universal help system,
>Got that: Called STguide. Full hypertext help system.

STguide is a built-in part of the operating system, sanctioned by Apple?
Is it included with the OS with every machine that shs? Is it widely
supported?

>% generally adhered-to human interface guidelines,
>Well, we have the guidelines. Newer programs use them. Older programs
>still don't unfortunately. I'll agree that the Mac is better here.

The excuse is always "newer programs use them." The last time I checked
Atari's user interface guidlines -- that was about a year ago -- they were
at most about six or seven pages long. The Mac's interface guidlines fit in
a whole book. Most programs adhere to most, if not all of them. (There are
some notable exceptions, however.) On the Mac, adherence to the HIG is the
norm, as opposed to the exception, as it is on the Atari.

>% background printing,
>This is plain silly. Any computer can do backgrund printing. Even my
>old XL did that...

You *MUST* be kidding. What program did you have on your XL that allowed
you to do background printing? The only program I remember that did background
printing on the ST was WordWriter ST, and then only from within itself.

>% built-in filesharing and networking?
>Got that. Got a full TCP/ip networking stack using SLIP,PLIP.PPP, or
>ethernet.

SO I can take an Atari out of the box, hook up one cable, click a few icons,
and share the files on my hard drive with a friend?

>Now: can the Mac load in external filesystems at will ?

Yes. Case in point: Apple's PC Exchange and CD-ROM software.

> Can it enable device drivers at will?

I'm not sure what you mean by this.

>Is the source code for the OS freely available for anyone to improve?

Is this actually a selling point? Of course the code isn't available!

>How much free s/w is there available - has GNU relented yet?

There is tons of free software. GNU isn't the only source of good software.

>How easy is
>it to get alternate windowing systems (Xwindows, Mgr) up and running ?

I don't know, because I've never tried. There are programs such as MacX,
so I can't imagine that it's hard.

>Any improvements on proper (dynamic) memory management yet ?

The next version of the OS is slated to improve this. Until then, I'll
use the standard Atari response and tell you that you can buy a product
such as RamDoubler to solve the problem until then.

>The Atari's OS is basically Unix, as long as you're running MultiTOS.
>I know most people don't. That's not because they're stupid, it's
>because they don't need to. The nice thing that it gives you is the
>huge amount of free high quality software for X and Unix.

It's because MultiTOS is slow! I remember when MultiTOS came out everyone
was complaining about how slow it is.

>MiNT/MultiTOS comes to ~200k when you are fully loaded with devices
>(ethernet etc). When I'm running X & fvwm I have approx 1.5Mb left -
>about the same as when I'm running under GEM, given the extras I
>load into GEM. It's rather amazing to get X into such a small space
>but it works, and rather well too.

200K including MiNT, the multitasking AES, multitasking Desktop, GDOS,
and all the other add-ons necessary to give the Atari features comparable
to the Mac?

What Have I attacked? I am sure the Falcon could have been with proper nourishment and so. The Jagflop with unique games and strong marketing and distribution would do very well. But, you know who is in charge to make it all happen. I attacked the merits of the 64 bits Jagflop, and it does not ad up and the games do not show it. Even the 32 bits 3do has nicer games..

You should read carefuly. TOS 4.X is not installed in that many ST's and is
not upto par with System 7.5 and that has been pointed out by others as well.
The TOS is a dead OS. It's the truth Jack..

: Rod

Actually it has gone from 3.25 to 3.85 in the last couple of days.
I guess because of the Saturn $350 anouncement.
I expect (hope) the price to jump with the cd and price reduction
press releases, if they ever occur.
On the other hand it has plunged from 7.50 to 3.5 in a few months.

%
% You're kidding, right? You mean you don't even know that all you have to
% do to delete a folder and all its contents is to drag the folder to the
% trash? Last time I checked, even TOS did it this way.

Well, TOS has done it that way from the start. You can make a better
example though... Say you have an immense C program, in a folder with
lots of sub-folders and sub-sub-folders. Now, you have a patch file
that's been distributed, which changes all the .c files of a particular
type. Unfortunately these files (called lib?????.c) are distributed
throughout the directories. So you need to back them up before making
the patch, but you haven't got the space to do a simple folder copy.
So how do you do it easily. Under unix it's simple - you use the `find'
command with the pattern `lib*.c' and the command `mv $file $file.bak'
or equivalent. Under a graphical OS it's more difficult.

Basically, I think this (religious) argument comes down to how many
files you have to deal with.. With few files it's generally easier to
click and point, but when you have large numbers of files to perform
operations on, there's no beating a powerful CLI. As for the CLAP's
claim that there's nothing a GUI can't do better than a CLI, well,
CRAP and CLAP are very similar...

ATB,
Simon.

In article <D5AEIx.Mzw@ecf.toronto.edu>, pischke@ecf.toronto.edu (PISCHKE DAVID) writes:

% My point is that the vast majority of programs out there do NOT use GDOS.
% Even when programs do use GDOS, some of them use it in strange, incompatible
% ways, or don't support the font-scaling capabilities.

Your point is wrong. About the only program I can think of that doesn't use
GDOS is Calamus. All the others can load and use GDOS fonts. Since the newer
NVDI (basically essential) and SpeedoGDOS are the equivalent of ATM, there
is no reason for any program to use anything else apart from historical
reasons (eg: Calamus).

% >% a universal clipboard,
% >got that: the GEM clipboard is used by loads of programs now.
%
% Last time I checked, most did not. My point is that *every* Mac program
% supports the Mac's font system and the Mac's clipboard. The same universality
% does not exist on the Atari.

When was the last time you checked, David? I agree that there is *greater*
homogeneity in the Mac market, but *lots* of new programs (ie: less than 1 year
old) have clipboard support. There is a proposal on the GEM-list to extend the
clipboard support at the moment. You don't extend things that no-one uses.

% >got that: MultiTOS. And it runs on anything from the lowest 520ST up
% >to the highest Medusa. Now if you mean there aren't many people using
% >it, that's different. That means they don't feel the need to run it.
%
% You must be kidding. I can run MultiTOS on a 520ST??

Hmm - I'm beginning to think you don't know what MultiTOS is. It's a .ttp
program that goes in the auto/ folder coupled with a new Desktop that is
multi-tasking aware. All the functionality that I've been advocating is
contained within that .ttp program. The desktop just adds a GEM interface
to multitasking (ie: multiple GEM programs as well as multiple processes).

The size of MULTITOS.PRG (or MINT.PRG) varies from ~90k to ~140k depending
on which version you're running. My version is ~135k. You can easily run
a program of that size on a 520ST. If you want to run the new AES as well,
(the GEM bit) you'll need 2Mb (probably 4 if you want to run a few apps).

I don't bother with the GEM bit myself - I use the vt52 level for most
of my work, or X if I need graphics.

% >% a universal help system,
% >Got that: Called STguide. Full hypertext help system.
%

% STguide is a built-in part of the operating system, sanctioned by Apple?
% Is it included with the OS with every machine that shs? Is it widely
% supported?

No. No. and Yes respectively. Almost all newer apps come with ST-Guide help.

% >% generally adhered-to human interface guidelines,
% >Well, we have the guidelines. Newer programs use them. Older programs
% >still don't unfortunately. I'll agree that the Mac is better here.
%
% The excuse is always "newer programs use them." The last time I checked
% Atari's user interface guidlines -- that was about a year ago -- they were
% at most about six or seven pages long. The Mac's interface guidlines fit in
% a whole book. Most programs adhere to most, if not all of them. (There are
% some notable exceptions, however.) On the Mac, adherence to the HIG is the
% norm, as opposed to the exception, as it is on the Atari.

It's not an excuse, it's a fact. That's why I keep saying it. I think you're
criticising the atari scene based on an outdated view.

% >% background printing,
% >This is plain silly. Any computer can do backgrund printing. Even my
% >old XL did that...
%
% You *MUST* be kidding. What program did you have on your XL that allowed
% you to do background printing? The only program I remember that did background
% printing on the ST was WordWriter ST, and then only from within itself.

You can do it under SpartaDOS on the XL, assuming you have the 256k expansion.
Standard utility.

Anyway, on the ST there are so many TSR programs to do background printing I'm
not going to list them all. Under MultiTOS, the best is probably GEM-spool.
Pick a file, drag to the GEM-spool icon. Spooled to disk at full speed and
printed in the background. OR anything that gets sent directly to the printer also
gets put in the print-queue.

% >% built-in filesharing and networking?
% >Got that. Got a full TCP/ip networking stack using SLIP,PLIP.PPP, or
% >ethernet.
%
% SO I can take an Atari out of the box, hook up one cable, click a few icons,
% and share the files on my hard drive with a friend?

No. Because the s/w doesn;t come shipped as standard. It's also more like
'edit file' than 'click icon', but that's due to the more general nature of
TCP/ip. I've yet to see an installation package for TCP on *any* system that
knows it's own ip address, for example.

% >Now: can the Mac load in external filesystems at will ?
% Yes. Case in point: Apple's PC Exchange and CD-ROM software.
So I can write (say) a compressing RAMdisk as a filesystem, put it somewhere in
the System/ folder and it automagically appears in the filesystem ?

% > Can it enable device drivers at will?
% I'm not sure what you mean by this.
It's the logical next step from external filesystems. If you have a standard interface for a device driver, you can install a new device (say, ethernet driver) by copying a file to the Mint/ folder

% >Is the source code for the OS freely available for anyone to improve?
% Is this actually a selling point? Of course the code isn't available!
I reckon it's one of the best things to have. Atari haven't done any development of the OS for a long time, but because the source is available, I have had 12 OS upgrades in the last year. Atari still act as a clearing house.

% >How much free s/w is there available - has GNU relented yet?
% There is tons of free software. GNU isn't the only source of good software.

Yes, I know, the point is that all the unix s/w works on the Atari. Not a small collection...

% >How easy is
% >it to get alternate windowing systems (Xwindows, Mgr) up and running ?
% I don't know, because I've never tried. There are programs such as MacX,
% so I can't imagine that it's hard.

With respect, just because someone's done it doesn't make it easy. X is free on the Atari, so is Mgr. We also have Linux/68k available. (I think the Mac only has BSD)

% >Any improvements on proper (dynamic) memory management yet ?
%
% The next version of the OS is slated to improve this. Until then, I'll
% use the standard Atari response and tell you that you can buy a product
% such as RamDoubler to solve the problem until then.

:-)

% >The Atari's OS is basically Unix, as long as you're running MultiTOS.
% >I know most people don't. That's not because they're stupid, it's
% >because they don't need to. The nice thing that it gives you is the
% >huge amount of free high quality software for X and Unix.
%
% It's because MultiTOS is slow! I remember when MultiTOS came out everyone
% was complaining about how slow it is.

Oh for God's sake! This has been done to death already. The reason the new AES was slow had nothing to do with MultiTOS - The AES was treated as a normal process, so to process mouse clicks etc. it waited until its process slot. The newer AES doesn't do this (it has select() if that means anything to you) so it's about 95% the speed of single-tasking TOS. The old AES was also very fast for computing. A really low overhead, but it lacked in what the user percieved - that was all.

% >MiNT/MultiTOS comes to ~200k when you are fully loaded with devices
% >(ethernet etc). When I'm running X & fvwm I have approx 1.5Mb left -
% >about the same as when I'm running under GEM, given the extras I

% >load into GEM. It's rather amazing to get X into such a small space
% >but it works, and rather well too.
%
% 200K including MiNT, the multitasking AES, multitasking Desktop, GDOS,
% and all the other add-ons necessary to give the Atari features comparable
% to the Mac?

200k gives you MiNT. another 400k gives you MultiAES. The memory use of GDOS depends on your fonts - I think NVDI3 requires at least 250k. So you're up and running in approx 1Mb. Now load in a couple of apps and you've got 3-4Mb used.

OTOH, I run a full unix-like system with virtual consoles, X windows, tcsh as my shell. I get 1200k left after running a few apps (window mgr, 2 terms, clock) And it's all free :-)))

ATB,
Simon.

: What Have I attacked? I am sure the Falcon could have been with proper
: nourishment and so.

Peter, for the last year you have been attacking the Falcon
constantly.

The Jagflop with unique games and strong marketing and
: distribution would do very well. But, you know who is in charge to make it all
: happen. I attacked the merits of the 64 bits Jagflop, and it does not ad up
: and the games do not show it. Even the 32 bits 3do has nicer games..

That's a matter of opinion. The 3DO games are more glitzy yes.
Why ... because they're on CD. While the Jag is capable of having large
memory cartridges, it would be too expensive. Hence ... a lot of the
full-motion video you see in 3DO games is not present in Jag games. IMHO,
Aliens Vs. Predator is one of the most impressive games ever stuck on a cart.

>*++-> Mac OS???

My point was that the Atari users on comp.sys.atari.advocacy complain that
the Mac OS is slow, and compare it to TOS -- but with NVDI and all those
other accelerators installed. I'm simply saying that it's not fair to add
accelerators to TOS and then compare it to an unaccelerated Mac OS. Either
you compare both OSes without acceleration, or both OSes with acceleration.
That way the comparison is fair.

I can use PC disks as well. I can bring up a screen full of filenames, and
I can identify them by the miniature icon and the file type description in the
"Kind" field in the Finder window. Of course I know what you can do with
an Atari -- I owned Atari computers for 11 years!

My point about universal fonts was that every Mac program supports the standard
Mac font system. I was not talking about any specific font types -- and
incidentally, TrueType was developed by Apple and licensed to Microsoft.
Can you honestly say that every (or even a majority) of Atari programs
fully support SpeedoGDOS?

guenther@cabal.shnet.org (Thorsten Guenther) writes:

>What does a 64bit 4 meg graphics board for the Mac cost (not mentioning
>that the NuBus is much slower than PCI)?

First up, we see the laughable ignorance most PC users have in
regard to anything practical. When you say "64 bit graphics" you are
referring to the largely useless bandwidth figures. When you see "24 bit"
graphics boards advertised for the Mac, the figure is referring to the
maximum color depth available on the card, a far more usefull figure.
Currently, all of those "64" and "128" bit graphics boards are merely
vanilla 24 bit graphics bords with a bandwidth too large to be used on
the majority of systems available. The Mac has 32 bit boards, which
refers to color depth. I have yet to see anything more than a 24bit
graphics card for the PC. I have yet to see a PC graphics board with
on-board DSP functions or software-specific drivers. I have yet to see a
PC board drive a HDTV display. And lastly, I have yet to see a PC
graphics board out-run a Mac graphics accellerator, high bandwidth
or not.

>"A GUI is better than a CLI in any case, yet CLIs for the Mac are there and
>they are much better than Unix CLIs." What Unix CLIs do you know?

Hmmm...csh, Emacs, vi, pico, nn, tin, pine, etc. They all have
different interfaces, and are all hideoulsy complicated. The amount of
effort poured into each of these different interfaces far outweighs any
benefit reaped from them. I will be switching to a SLIP account and the
accompanying GUI internet tools next month, thank god. Perhaps I can get
some real work done then.

Anyway, what is Atari doing
: these days? Are the Tramiels still around?

Atari's years of pissing off it's customers resulted in the
company downsizing massively after sales collapsed in the ST arena. The
Tramiel's are still in control, but seem to be doing a lot better in the
way of running Atari these days. Atari's main product is the Jaguar
console, though a few Lynxes and Falcons are still being sold.

Peter, that really shows some intelligence and resoursfullness on your part.

Here's a typical day for Pete on the Net:
I wont bother PC groups, they are too big.
OOH look, the Atari and Amiga groups are relatively small.
Atari and Amiga people could be using Macs.
Let me boost my ego and annoy them.
Look, wow, have some attention. (yes I am guilty of this too)

So you like Macs. They are relatively decent computers, way more usable for
the illiterate than PCs were.PCs must be doing something right though, like err
selling well. For people who are different and prefer Amigas or Atari gear,
they are fine (if you can handle searching endlessly for soft/hard ware).
What's your beef with them? AND WHY ARE YOU HERE (bold type, but in case you
cant read). Oh I forgot, you own a Lynx. That makes you an expert on all things
Atari.

Peter, I will give you an advice: don't you think you have made yourself
ridiculous enough ? You've been flaming for years Atari, the ST, the Falcon,
the Jaguar, the Amiga, in postings written in a language quite hard to understand
for a non-english person like me, although I must admit that you speak quite well
for a 10-years old child like you (I hope that your english is better than mine).
And now you say "What have I attacked ?". You're joking, aren't you ?
Moreover, you've been posting Mac price lists and ads taken from MacWarehouse
(or was it Toys are us ?) which nobody here cares about. Did all this bring
something to the threads ? Do you really think that you conviced Atari users with
your attitude ? Do you really think that starting flame threads where you try to
say "My computer is better than yours" is a constructive debate ? WHY DON'T YOU
LEAVE THIS GROUP AND GO TO ALT.SEX TO POST THINGS LIKE "MY D**K IS BIGGER THAN
YOURS" ? I'm sure you would feel a great relief.
Come on, Peter, grow up.

|> "I wouldn't know him if he walked in the room. I've got other things to with

The "largely useless bandwidth figures" show that a 64 bit board has much
higher refresh rates than a 32 bit one. Laughable, eh?

>When you see "24 bit"
>graphics boards advertised for the Mac, the figure is referring to the
>maximum color depth available on the card, a far more usefull figure.

This figure is totally useless without given refresh rates, sorry pal, you
lose.

>Currently, all of those "64" and "128" bit graphics boards are merely
>vanilla 24 bit graphics bords with a bandwidth too large to be used on
>the majority of systems available.

Yeah right, for example the ATI Graphics Pro Turbo allows you to use 32
bit depth with a resolution of 1152*864 in 73 Hz non-laced. That's good
for 19" monitors as used in EPP/DTP.

>The Mac has 32 bit boards, which
>refers to color depth. I have yet to see anything more than a 24bit
>graphics card for the PC.

See above.

>I have yet to see a PC graphics board with

And again, the idea that Macs are for people too stupid to use other
computers is strengthened by a Mac-o-Droid.

Gotta get me a Motorola Entry Workstation as shown on the CeBit.

Then maybe you should take some typing-lessons and read a couple of manuals. I`m sure you will find that once you learn how to fully use a CLI most operations will become easier.

> Have you ever used a good GUI (Mac, NeXTStep).

Of course!

> A GUI allows you quicker
> access to and more precise control over your sustem and its rescources.

No, this isn`t true if you`re a skilled typist that has taken the time to learn the CLI inside and out. There are only a few areas (mainly graphical oriented) where a GUI outperforms a CLI if the user is what I call a "power-user". For beginners or for people that doesn`t require immediate access to the most advanced functions, a GUI might be a good thing. For a "power-user" that knows the system inside and out and that requires full control over the machine, a CLI is in most cases both faster and easier.

A stupid example:

Find all files on the disk that matches a _complex_ regular expression and compress them with your favourite packer (gzip :-). This is very easy to do from a CLI (find | grep | gzip), but try to do it from a GUI and you will see what I mean.

PS! Don`t get me wrong. GUIs are good for many things and the world has definately became a better place since they were introduced, but to get the most out of a computer the best thing is to have a GUI with a CLI-window! :-)

Let me set up a complete (and stupid) example. You need to compress all the files on all your mounted volumes that begin with "Lib" and end with ".c", they must have at least one 'X' in their name but not two 'X's in a row, the files must have been created more than a week ago but more than a month ago, they must be larger than 15K (so they are worth compressing) and smaller than 500K, they must have been modified last Tuesday, they must be locked and associated with your secret "FlagShip" project, they must be documents (ie not applications,stationary,aliases,links,directories,...) and the comments for the document contain the word "Snoopy" but not "dopy doo". That would take me about 1 minute to initiate on my mac. Obviosly the search time would be large if I had a lot of mounted volumes and a lot of hits would mean a huge compression time. And the method for doing this is simple and intuitive.

nn "hideously complicated"? What are you talking about!? nn is one of
the simplest programs I have ever used. nn is much easier (and faster!)
than any other usenet reader I have used, including graphical ones.
For example, using the Favorite Newsgroup program on the Mac, a GUI
newsreader, is pure torture. It is excessively slow, frequently runs
out of memory and locks up if you read a large thread, and forces you
to save your "usenet preferences" (the groups that you happened to read)
before letting you exit it. It also lacks niceties like kill files. I
know there are better GUI newsreaders than that, but it still shows that
a GUI program isn't necessarily better than a CLI one.

I agree with just about everythin you're saying here, with ONE qualification.
All the people you are talking about here(ie. musicians) are people you
know or have met through telecommunicating(BBS, Internet) I personally
know of five friends who are professional musicians using ST's who have never
and may never 'hook up' to the Internet. One has to be careful about
extrapolating from the Internet. We are NOT representative of the
general Atari users, nor of the general population, Musicians are STILL buting
St's and STe's for MIDI(check out c.s.a.s) and a friend of mine just bought a
1040STe last year for the MIDI ONLY!

>That's my point here.. yes there are people who use the MIDI ports, but
it's>no way 90% of ST owners.. it's not even likely 10%. Most people
probably>looked at them when they took the ST out of the box and then forgot
they>even existed.

I think you're just pulling numbers out of the air here.
Would it not be more usefull, or accurate to simply say that a majority of ST
users don't use MIDI, unless you have some hard figures to back you up :^)

>It's not a really big deal... I really don't care that I had to pay for

I don't think this counts so much. I mean people who buy a console usually are not concerned with computers. Most of my friends who own a console never owned a computer. If the Jaguar fails, it will be for other reasons.
Moreover, Atari has always put more weight on the game side, from the Atari 400 to the ST, which were considered more like some game machines than some serious computers, probably because of the 2600 success. Even if the guys ruling the company are not the same today, I think we can trust Atari for the support of the Jaguar. I wouldn't say the same for a new Atari computer. Even if a new computer was released today, being say two or three years technologically advanced compared to the PC, it wouldn't be sold enough, because of the PC market. Unless the price is very attractive.

When was the Falcon designed? Let's talk about the Macintoshes from that
era, since that is the only fair comparison. All this talk of PowerMacs
and System 7.5 when we're shooting at a 1990-1991 target, is senseless.

> For a few days, I actually was hopeful that this thread wasn't going to

Does anyone have any ideas how I could transfer text files from my 1040ST
to my LCII?
I thought I might be able to rig a cable from the St modem port to my mac,
and use Zterm to communicate with the telecommunications program that came
with the ST. I don't have a modem for the ST.

I hope I'm not S.O.L because I'm from AOL.
Thanks in advance.

Transferring files from an ST to a Mac by way of the serial ports should work...

Just be sure to use what's called a "null modem" cable between the two computers. (This reverses the transmit and receive lines so the sending line of one connects to the receiving end of the other, and vice versa).

Null modem cables or adapters should be available at any well-stocked computer store or Radio Shack.

As for the "telecommunications program that came with the ST", if you mean the VT-52 emulator accessory that comes on the "Language Disk" with the ST, that won't work, as the program doesn't have any file transfer protocols in it.

You'll need to obtain an Atari telecom program like ConNect or STorm, or one of the commercial programs like Flash II, (unless the program you mentioned isn't the VT-52 emulator, and has protocols in it that match Zterm). AOL may have those available in their Atari download areas, or you can ftp them from atari.archive.umich.edu or one of the other Atari sites.

Since you mentioned not having a modem for the ST, that could involve a bit of a "Catch 22" unless your Mac can write to MS-DOS disks. If it CAN do this, format an MS-DOS disk as a 720K floppy (the Atari can't use High Density disks, so you have to be sure to format the disk as a 720K), then copy the files onto the MS-DOS disk. The Atari should be able to read the files directly from the disk.

The next hurdle would be that the files are almost certainly compressed, either with LZH or ZIP. If you have those compression utilities on the Mac, you can uncompress them there, then just copy all the uncompressed files onto the disk to transfer to the ST. Otherwise you'll need to get the proper Atari uncompression programs, again either from AOL or an ftp site. (If there are any local BBSs near you with Atari file sections, you'll probably be able to get these files and programs from them.)

Another thought is that if you CAN format MS-DOS floppies, and the files you need to transfer are smaller than 720K, you can just use the floppies to transfer the files between the two systems.

The Atari ST shares almost the exact same floppy disk format that the PC does, so the trick is to format the disk *on the Mac* using the "Mac File Exchange" program (or whatever it's called) to insure compatibility.

>I hope I'm not S.O.L because I'm from AOL.

It would be a lot easier if you were on CompuServe, because I could point you to the exact files in our software libraries. Everything you'd need is available there, including direct contact with a lot of knowledgable people including a lot of Atari Corp folks... but ... it shouldn't be an insurmountable hurdle.

Source record: 13321
Cross-posted to: rec.games.video.atari,comp.sys.atari.advocacy

From the AP wire:

SADI (Senseless Anti-Atari Drivel Inc.) announced on Thursday, March 16, that they were discontinuing their primary Internet product, the Peter Sinclair Bullshit Generator (PSBG). As of April 1st, 1995, no more PSBGs will be manufactured, though existing models should be around well into the next century, rotting in various warehouses all over the state of Iowa.

As to why the PSBG had been discontinued, Colonel Clueless, the President of SADI, would only say that "We believed that it was our moral obligation to do it. Discontinuing the PSBG will make the world a much better place." However, an ex SADI employee, who requested anonymity, has told us that the real reason why the PSBG was discontinued was because it had a severe flaw that even SADI's brightest researchers couldn't fix: Once the PSBG was turned on, there was no way to shut it off. It is also rumored that the PSBG has a penchant for making slanderous statements, and that these statements have cost SADI millions of dollars in damages from class-action libel suits by Atari users.

Whatever the reasons behind it are, the discontinuation of the Peter Sinclair Bullshit Generator will be effective April 1st, as stated above.

In other news, SADI announced that they plan on introducing a new product in June: the Peter Sinclair Exterminator. Colonel Clueless said that according to extensive research conducted by his marketing department, there is great demand for such a product and that it should be an immediate best seller.

Heck, who'd buy the GEMulator or the Janus board or MagiCMac for running
games? The games available for the PC are much better in general, with
some exceptions like "Oxyd 2" or other Atari specific ones.

MagiCMac, for example, is for the Atari user who needs better hardware and
for the Mac user who needs cheaper software (well, some Mac users might
find out that Phoenix is somewhat cheaper than relational Mac databases,
and some DTP professional I met recently uses both Quark and CSL on the
same hardware platform, plus Avant Vektor under MagiCMac, etc.).

Hello !

From Atari itself there comes only the Jaguar and I don't think there will be
a new computer :(. But in Germany are many companies, which are developing
hard- and software. At the moment there exist two companies who are selling
Atari-clones, which are more powerful than the original Ataris (Eagle and
and Medusa). Also other companies sell Falcons, but normally in Desktop or
Towers with graphic-card etc., so this computers are better than the original.
Software and OS is still developed now. The Os's at the moment are Mint, MagiC,
MagiCMac or Linux.

Re: GEMulator

>>Games are not one of its strong points though.

>Heck, who'd buy the GEMulator ... for running _games_?

I agree that games on the PC have moved far beyond most of what's available on the ST, but the first thing a lot of people think of when they hear about these emulators is running their collection of games... (I still have to tell disapointed Atari 8 bit users that they won't be able to play most of their Atari 800 games on an ST with the ST Xformer emulator..)

That message was in answer to a question from someone who specifically mentioned wanting to run their ST games on a GEMulator too, incidentally.

I take it the first part of this is some sort of insult? *shrug* It comes across rather badly, I'm afraid. But anyway...I watch precious little television. When my tee-vee IS turned on, it's usually tuned to Comedy Central (MST3K, you know) or E! (Howard Stern). But the issue isn't who watches what TV show.
If $1 US = 1.4 DMs, that would make an Apple floppy drive ~112 DMs. Since the original poster claimed that it was significantly more (was 500 DMs the figure? I forget) I can only imagine that, for some reason, there's a ~380 DM "tax" or other penalty on the floppy drive. In which case I would blame the government of the country rather than Apple.

: >as the "cheap" drive currently costs ~$80 US here.

No, it says nothing of the sort. Not to anyone who isn't an entrenched fanatic about the Atari, anyway, and makes him/herself feel better by making laughable attempts at putting down other machines.

: Many of them have useable colour modes equivalent to 1 meg High Colour PC
: boards, and few have more.

Right. For most home users, this is sufficient. For higher-end users, video cards are available. Your point being...?

>Yep, and? What does this say other than Apple are still trying to fool
>their customers here?

Smart boy, eh ? The guy you quoted said he'd have to guess the exchange
rate from the price of the drive. The US isn't as focused on germany as
germany is focused on the US, so not everyone knows exchange rates.
(BTW, CNN always talked about the yen first and then about the mark.)
It is not a good style of discussion to imply that someone is dumb
because he doesn't know something.

Last time I checked, disk drives for the Mac were closer to 200 DM
than to 500 DM.

Well, I got the 500 DMs from a Mac user. As I don't buy MacUp or Macwelt,
I tried verifying it by having a look into c't. Guess what? These drives
are not even announced there. I'll check out the MacUp tomorrow, just to
be sure about the price.

Incidentally I had a stop at a suburban train station today, and bought
the MacUp 4/95 right there. A longer check of several ads puzzled me: not
a single disk drive is listed. This means:

- Apple users are too stupid to replace a defective disk drive, so the
dealer has to do it for them
or
- Apple disk drives are built for eternity

Which one is right?

And sorry, this _lowers_ my image of Apple, to me it seems Apple considers
their machines something special, something the customer should treat as
sacred and not touch the inside at all. This attitude is what I always
hated most about Apple. The machines are fine, but the company sucks.

Hopefully this will change soon.

Yes that is true, but I think perhaps Time Warner and Sega (although
in a minority) should start to apply the thumb screws, if the
management dont ge their act together.

The problem is, the Tramiel family owns over 51% of the stock.

All T-W and Sega can do is to send representatives to the annual stockholders meeting and watch the Tramiels vote themselves back into office every year.

There's really nothing they or anyone else can do about it.

What are you getting at? Disk drive replacement and parts are listed in Mac mags here in the U.S. My Performa 550 has removable front and back panels for getting inside. i can slide out my motherboard, HD, drive, cdrom for replacement and upgrades..

Unh, I don't call NVDI/ET4000 an accelerator. My graphic card would have
to use the outdated TKR Crazy Dots drivers if I hadn't bought NVDI. In
fact, NVDI is a VDI, it just replaces a part of the OS. Quick ST and
similar programs are accelerators.

>I'm simply saying that it's not fair to add
>accelerators to TOS and then compare it to an unaccelerated Mac OS. Either
>you compare both OSes without acceleration, or both OSes with acceleration.
>That way the comparison is fair.

What acceleration is there for MacOS?
For maximum speed, I'd advise NVDI, Kobold, SCSI-Tools, TCache (I don't
use the last one, but as it allows write-caching, it even speeds up
systems where HuSHI already runs with cache. For maximum usability, even
more software is necessary.

>>*+=-> No, I don't see an advantage in long filenames.

James Woods' statement? Stupid.

>My point about universal fonts was that every Mac program supports the standard
>Mac font system. I was not talking about any specific font types -- and
>incidentally, TrueType was developed by Apple and licensed to Microsoft.

>fully support SpeedoGDOS?

Word processors do, desktop replacements do. This editor (Everest) does
only support monospaced pixel fonts, AFAIK. And the most useful place
where TrueType and Speedo fonts can be used is a word processor. In other
apps, well, what does it matter if it's monospaced?

Sort of like Atari, eh..?

Atari NEVER made it easy to get inside their computers, because they had exactly that same attitude. If you wanted an upgrade, you were SUPPOSED to buy a new machine from them. (Atari reps even said this, in so many words.. it's not just my speculation).

The cases were screwed securely together, and in some cases the metal RF shielding inside was soldered shut, making it even more difficult to get into, and reinforcing the idea that they didn't WANT you getting in there.

There were even indications that when people found ways to upgrade the machines without Atari's permission, they went so far as to redesign the systems to make it harder to upgrade them.

This isn't true. You only must look at the development of the Atari from ST
to Falcon. Your are right in the case of the ST; Floppy-disk is Shugart but
an own adapter, ACSI instead of SCSI, no Bus for Extensions, more RAM only
if you solder it on your own....
But later they changed this mistakes. There is added a real SCSI-Port, first
the Mega-Bus (just again an Atari-specific format) and later the VME-Bus.
You can also use SIMMS etc.
So I think it's the other way round as you have written.

: >This attitude is what I always hated most about Apple. The machines
: >are fine but the company sucks.

: Are you sure you didn't mean to type "Atari" there...?

I don't want to attack or defend a company. We are discussing about the
computers and their software. At this point the Atari in this time isn't
the best hardware, but the Software makes it look better. Just thinking
about the existing Clones even the hardware is good , but looks expensive.

>So I think it's the other way round as you have written.

I will say that I've never taken a Falcon apart, but given the similarity of the case to the 1040 ST, I'd be surprised if they'd made it any easier to get inside, which was the point of my comments. If Apple is to be taken to task for making it hard to get inside their computers, Atari is no better.

It's true my comments are based on experience with the ST line, where Atari deliberately tried to make it difficult to get into and upgrade their systems, which is what it sounded as if Thorsten was getting at about Apple.

If Atari has made it easier to get into the Falcon, then that's great.

>I don't want to attack or defend a company. We are discussing about the
>computers and their software.

No.. this particular discussion, and my reply to Thorsten IS about the companies and their attitudes toward their customers. Read the part of his message that I quoted.

"And sorry, this _lowers_ my image of Apple, to me it seems Apple considers their machines something special, something the customer should treat as sacred and not touch the inside at all."

(Aside to Thorsten... I'm really not trying to make this all sound like any kind of attack on you, by naming you here... I just feel that your comments apply very strongly to Atari also... sorry too if I've misspelled your name.. I don't have the copies of your messages on this system I'm using right now.)

From what I understand (it could be dated or downright wrong),
Jack and the board of directors held 51% of the stock back in 1991.
Since that time however, Time Warner received 2.4% extra stock and Sega
received 7.8% of Atari stock.

Agreed, Atari tried this also, but they didn't succeed with this attitude,
Apple did. The funny thing is that Normen Kowalewski, for example, now
working for Atari Sunnyvale, started his career in Germany with the
Hypercache 030 board (at that time, a 030 compatible TOS was not avilable
at all).

Nowadays, Atari hardware can be modified, patched and upgraded in numerous
ways, whereas Apple hardware modifications still are a rare beast (well,
the clock patch that speeds up several of them has been published in c't,
plus the PAK project of the c't is compatible not only with Ataris, but
also with Macs, AFAIK, but that's it, no graphics board for a Mac/Mac
Plus, no Centronics port (while one is able to install an eSCC based high
speed serial interface into STs), etc.).

The most complicate by getting inside is to remove a few screws and the metal
shield. Even for upgrading the memory, you can go to the slots without removing
the shield.

M>

Yup, the Tramiels are still around. Atari is still making the TT030 and the
Falcon030 (decendents of the ST line), but only in very limited numbers. They
are mainly concentrating on the Jaguar 64-bit game system for now. If that
pans out, we may see a new computer line from Atari yet...

You're kidding, right? There are tons of NuBus cards out there. There are
cards for the LC PDS slot, there are accelerators for older Macs (and new
ones!).

> AFAIK, but that's it, no graphics board for a Mac/Mac Plus

First of all, anybody who would want to install a graphics board into a
Mac 128, 512E or Mac Plus is insane -- those machines are ten years old.
They don't have the horsepower to do high-resolution colour graphics and
run today's programs. Secondly, it might be revealing to ask how many
graphics boards there are out there for ten year-old Atari models (ie, the
1040ST and the 520ST). The fact is that neither Macintosh nor Atari are
closed architectures any longer.

>no Centronics port (while one is able to install an eSCC based high
>speed serial interface into STs), etc.).

Centronics ports are going to be obsolete in a few years, anyway, with the
advent of FireWire. Why invest in a technology that's going to be dead
soon?

I agree. FSEARCH7 for Atari does exactly the same, and it supports also
UNIX-type *.[A][LR][LRB] (e.g Song.ARR, song.ALL, SONG.ARB, SONG.ALB).
Also, you can have a list of the found items in a window, and you can
lauch it to an application from there.

CLI-only applications are a pain in the butt, but combined with GUI
(especially when CLI-functions are available only when needed) is the way
to go.

Exactly true. PC users get all nervous and jerky when they find out that
on a Mac you don't have to mess with config.sys, autoexec.bat, and ini
files. Somehow it seems to make them think they don't have control.

> I often
> must help them to configure the system, install new things etc.. When I

> crashed and I work with it much more.

Users can make any system unreliable. I had to help out a guy at work who
had over two megs of extensions loaded into his system (his initial
complaint was about lack of memory). Once I cleaned out all the extensions
that he didn't use (or couldn't identify), he not only had more memory, but
was simply amazed that his system didn't crash anymore. Personally, I was
amazed he ever got it to boot at all. Nobody has to live with a regularly
crashing computer. Even a niche architecture like Atari can be extremely
reliable.

This trends toward excessively adding in functionality at the OS level is a
common problem with PCs, Macs, yes, and even Ataris, and is the first thing
I look at when called in to troubleshoot a system. Macs and Ataris are

simple to figure out where the add-ins are and what they do, but in the PC world you are thrown into a maze of interlocking setup and startup files, which makes it difficult to establish a standard configuration from which to begin.

OK, try this. We're talking System 7 (7.5 I think). There's an Apple-
supplied utility which allows you to associate a sound file with events
like open dialogue box, system beep, file transfer complete, etc.. For
System 6 there was a shareware app which did the same sort of thing, and
we had a nice collection of sound bites for that.

The new thingy uses some kind of weird subfolder within the System folder.
We try dragging soundfiles from the old folder into this special one:
twang! Machine refuses to move the file, says it doesn't belong in that
folder. Hm. OK, let's have a look at a legit. file from the new folder
and see what the "file type" is. Ah. Can't get _Set File Attributes_ to
work on something in that special folder. OK, let's drag it onto the
desktop for examination.

Twang! There's an application open somewhere -- can't move system files.
Oh yeah, that's right, we never quit so-and-so, let's do so now. Done.
Now we drag the file onto the desktop and ascertain that its type is
"sfil" (and the creator was "movr"). Now put it back, change the type
of our favourite laugh _HehHehHeh/11 KHz_ to "sfil", and drag that into
the system sound folder. Ha! It works! We fooled the Mac! Now let's
see what it sounds like ... "and error type -39 occurred". Ah Shit.

Now the moral is: what we were trying to do was never going to work,
and most of the "obstructiveness" of the Mac was entirely justified.
What good could come of putting non-system files into a system folder?
Suppose we were playing about with one of those system sounds when
an application needed it? Etc. What we needed (but didn't have,
because some fool mislaid it) was the right application to take an
arbitrary sound file and translate it into whatever format the new
Mac sound system requires.

Will that do for an example? :)

There is no such utility included on either the System 7.1 disks, the system
7.5 disks, or the System 7.5 Update disks. Apple does not supply such a
utility with its standard system disks, and I'm pretty sure it doesn't make
such a program at all.

>The new thingy uses some kind of weird subfolder within the System folder.

I think you're confused. You're thinking the System FILE, not the System
folder. What you are trying to do is drag a sound to the system *file*.
The System file is located inside the system folder. Among other things, the
system file contains keyboard layouts, sounds and scripts. The sounds
contained in the System file are used for system beeps. All applications
can access the sounds contained in the system file and use them as they wish.
(For example, to chime on the hour, as the Date and Time control panel can.)

>We try dragging soundfiles from the old folder into this special one:
>twang! Machine refuses to move the file, says it doesn't belong in that

That's because it's not a folder. It's a file. How can you set the type and
creator of data contained in a file?

>OK, let's drag it onto the desktop for examination.
>Twang! There's an application open somewhere -- can't move system files.

The System only prevents you from moving files out of the system folder in
two cases: if you try to move a font, or if you try to move a sound or
keyboard layout. That's because fonts, sounds, and keyboards are stored in
the system file itself. Many applications find it surprising if the system
file changes size without warning.

>Oh yeah, that's right, we never quit so-and-so, let's do so now. Done.

You can put as many non-system files into the system folder as you want.
You just can't but non-system items into the system file itself.

>Suppose we were playing about with one of those system sounds when

>Will that do for an example? :)

I think I must have missed your point. You tried to do something that made
no sense whatsoever, and the Mac tried to stop you. The Atari does the same
thing - for example, it doesn't let you execute files which are not executable,
and so on. I was looking for an instance where the Mac prevents a user from
doing something he wants to do, when there isn't a valid technical reason
(Ie, the action is impossible) for it.

Someone told me "there are accelerators for older Macs". Well, so there
are for Ataris, the 50 MHz 030 PAK/FRAK solution is presumably the
fastest still available (FR stands for FastRAM).

>Secondly, it might be revealing to ask how many
>graphics boards there are out there for ten year-old Atari models (ie, the
>1040ST and the 520ST).

Quite a lot, thanks. It's just that they don't fit into the original case.
There are the following ways of installing them:
- adding a MegaBus + Atari specific graphics board
- adding an AT bus + PC graphics board (any ET4000 is supplied with 3rd party
drivers, yet the Nova drivers (ATI Mach 32/64) are not advertised as
general purpose ones for this solution)

>>no Centronics port (while one is able to install an eSCC based high
>>speed serial interface into STs), etc.).
>
>Centronics ports are going to be obsolete in a few years, anyway, with the

>pans out, we may see a new computer line from Atari yet...

I have to comment on that: C-Lab are producing the Falcon Mk II
(advantages: 14 megs standard (original: 4 megs), internal SCSI hard disk
(the original had an IDE internally and SCSI port only), better sound
quality (ADC/DAC quality higher, no bass booster)). This machine is aimed
at the music/MIDI market and advertised for 4,950 DMs (3,500 US$), but the
real life retail price is said to be more around 2,200 US$s.

And I don't xpect any new computer line from Atari. If there comes one, I
hope it'll be standard PReP hardware with MultiTOS/TOS 5, for that's the
only way the machine could have some success.

A standard printer is one that connects to a computer's parallel port.
All computers have parellel ports, except Macs of course BECAUSE APPLE
JUST HAD TO BE DIFFERENT! Many printers can be connected to the Mac's
non-standard serial port in addition to the industry-standard parallel
port, but many don't.

To most of the non-MacSpeaking world, it means an Epson-compatible,
probably 180 or 360 dpi, with a Centronix interface. So you need a
parallel-to-serial converter and a suitable driver (e.g. Chuck's
Printer Driver, or I think Epson themselves sell something).

Or did they bundle *that* with Sys7.5 as well???

I assume you mean do-it-yourself enhancements? With the Mac, you don't
need to! You can plug in cards. Admittedly, many people do overclock their
Macs, though.

>Someone told me "there are accelerators for older Macs". Well, so there

Do you really think that the fact that you can add a graphics card to the
520ST, but that it won't even fit into the case, is some kind of advantage?
I would think that anyone who can afford a graphics card for either a 520ST
or a Mac Plus would be able to afford the few hundred dollars to upgrade to
a used machine with slots, such as a Mac II (circa 1987) or a Mega STe on the
Atari side.

Because centronics is an outdated technology which isn't necessary, and can
be avoided with an inexpensive cable?

OK, I admit it, as David says I was confused. Something which tends to
happen whenever I start playing with fonts, DSs, and System files: the
good ol' direct-manipulation paradigm starts to break down, and I never
know quite what to replace it with. I can even get nostalgic for
ASSIGN.SYS :).

>[... much deleted...]

>I think I must have missed your point.

Point? What point? Oh yes. That the Mac sometimes stops you doing
things which are physically possible, because they *might* cause a
problem later. (E.g. the "must close all applications first" thing).

>You tried to do something that made
>no sense whatsoever, and the Mac tried to stop you. The Atari does the same
>thing - for example, it doesn't let you execute files which are not executable,
>and so on.

But it will let you try to browse (or print) just about anything, with
all the bleeping and formfeeding that implies. And if you rename a
PRG as .ACC and stick it in the root directory, I think you'll get
yourself into a pickle ... (unless it's a trick program designed to
work like that).

>I was looking for an instance where the Mac prevents a user from
>doing something he wants to do, when there isn't a valid technical reason
>(Ie, the action is impossible) for it.

Ah but you didn't *say* that. :)

I can just imagine the response if the Mac *did* let users do things like
put non-sounds into the System file as sounds, or change the size of the
System file when other applications are running. Then the Atari advocates
would complain about how the Mac crashes all the time.

Actually, my own Atari has rarely failed me. But then again, I cosider TOS computers to be for people who know what they are doing and who enjoy doing it, whereas the Apple is the fool-proof system for people who don't know how a computer works and have no intention whatsoever to learn about it. They just have a job to do that they want done. Fine with me. If they're happy with it, ok. Just don't try to make _me_ use it, because I like to be in complete control of the system, something the Mac does not allow me to be. What do I use my Atari for? Word processing, reading diskmags, listen to/create music (ProTracker), view/alter graphics (for which I have a Nova VME 16M graphics card) and generally have fun (programming the hardware directly with the intention of creating a new OS just for the heck of it). Like an average Mac user is not happy about editing files and programming the system, I'm not happy unless I'm allowed to do it...

Conclusion: TOS is for people who want freedom
System 7 is for people who just want to do their job

: Hm, I remember hearing that a few years ago. Was going to replace MIDI as
: well. :)

FireWire, to the best of my knowledge, didn't really exist until last year or thereabouts. I dunno about the MIDI thing, but it was/is designed as a very high speed, multiple device, asynchronous communication system. It may eventually become the "new SCSI".

But anyway...So the Mac doesn't have an ancient, outdated, oversized Centronics port. Big deal. It DOES have a competant printer/Appletalk port, for which there are dozens of Mac-specific printers available. (And with the addition of a third-party package, you can access any PC-specific printer as well.) If it gets the job done at least as well as yesterday's technology, why are you bothering with the complaints?

830. Does the Mac *really* inhibit users (was: Time for some ADVOCACY.....)

Like me? (Look at the Organization line)

>I like to be in complete control of the system, something the Mac does not
>allow me to be.

Are you *really* in complete control of the system, or does the editing of
ASSIGN.SYS and such just create the illusion that you are? Does installing
a font by editing an ASSIGN.SYS file somehow give you more control than
installing it by dragging it to a "Fonts" folder?

If you want to change around the system, just get a copy of ResEdit, and you
can alter it to your heart's content. Just read comp.sys.mac.* any day,
and you'll see tons of articles from people trying to alter their system.

831. ST & Software for Sale (USA)

Newsgroup: comp.sys.atari.advocacy
Date: 1995-03-25 17:08:01 UTC
From: dwerden@aol.com
Message-ID: <3l1ilh$db9@newsbf02.news.aol.com>
Source record: 13281

I am moving to Macintosh and now want to sell a very extensive Atari St setup. It have:

Atari 520 STFM 2.5 meg with AdSpeed accelerator
Atari Monochrome monitor
External shoebox drive with Syquest removeable drive
Spectre GCR Mac emulator with ROMs
Pagestream (latest version)
Calumus 1.09
Wordperfect
Copyist DTP
Dr. T's KCS
Lots of other commercial software
Lots of PD disks
Some Atari books
Some Atari magazines

I am looking to sell the whole bunch as a package for $900 shipped to you.

I also have

Atari 520 ST - 1 meg
Atari Monochrome monitor
Supra 20meg external drive

Will sell this package for $250

If this is not the right place for this posting, please let me know and I will move it. Thanks.

Dave Werden, U.S. Coast Guard Band

That I already own a 1 meg card inside my TT and are not going to buy any
Mac with less than 2 megs VRAM. And these _are_ expensive beasts, still.

Whereas the Motorola Entry Workstation presented on the CeBit seems to be
much more open hardware-wise.

: dovumentation, for example - Atari has aone. And on the Mac you cannot
: hook up a standrad printer without extra hard- and software.

Please define "standard", Alfred, and remember that with the exception of dot matrix printers, there aren't too many "PC printers" that won't connect to a Mac. Most printers these days have either multiple ports (i.e., a "PC" port and an Appletalk or Ethernet port) or have multiple models, one for Mac and one for PC (i.e., DeskWriter and DeskJet).

The big deal is that their many more Epson-compatible, "ancient, outdated, oversized" Centronix-port interfacing computers out their than Apple ones. By using a different port than the rest of the industry, Apple restricted the choices of its users.

And what really gets me is that the main reason why Apple did it was so that they could sell their own printers (like the LaserWriter) to Mac users at inflated prices - which they did. They were able to get away with grossly overpricing their printers for years because, until 1990 or so, only Apple made Mac-compatible printers. Mac users had a choice between buying an a competitvely-priced Epson-compatible and an parallel-to-serial adaptor (a combination that often didn't work) or an over-priced, Apple-made, Mac-compatible printer. (I know at least one person who switched from Macs to PCs precisely because he was annoyed by the need to use non-standard peripherals, like serial-port-interfacing printers, on the Mac). The serial port was just a quirk put into the Mac by Apple to increase its profits.

And BTW isn't the Centronix parallel port capable (in theory at least) of higher performance than the Mac's Apple-Talk serial port? Looks like the Mac is also using outdated technology.

Your right that isn't a big problem now. But from the introduction of the Mac
through about 1990 it was a *huge* problem. In that time period (roughly
three quarters of a decade) Mac users were forced to buy either Apple's
over-priced priced printers or competitively priced Epson-compatible printers
plus a parallel-to-serial adaptor. And the Epson-compatible printer/adaptor
combination often didn't work! One of Freshman-year suitemates, an ex-Mac
user, tried to connect an Epson (not a compatible, an *actual* Epson) to his
Mac Plus with an adaptor AND THE THING JUST WOULDN'T PRINT! (in case you're
wondering, he's now a very satisfied PC user). On other words, the serial
port was basically a dongle by Apple (I'm sure they could have put a parallel
port in the Mac if they wanted to).

Well, I don't know what your intentions are, but I would never hire a computer engineer who has only experience with Macs from an end-user perspective. Neither would I hire a computer engineer who proudly puts "Word, Excel and Lotus" on his resume, and nothing about programing abilities.

No, but patching the OS with home-made TSRs and knowing how each system call works does. Knowing exactly what each application does to do its job, and altering them with a debugger does. Of course, a lot of what I do is not typical end-user stuff, and I never claimed it was. (see http://www.hials.no/~ga/resume.html any time)

I don't think ResEdit on System 7 will alter your system as much as TurboAssembler can alter my TOS. Can you alter the memory management routines with ResEdit? How about optimizing your disk usage a little?

Distribution:

: Good one..

The truth.

: Intel ones, eh?

Intel doesn't make printers. If you mean Intel machines, yes.
About 95% of the computers on this campus are PC clones. Macs are nearly
impossible to find. Almost as many people use Amigas and ST's.

: Yep? Read above..

Where Peter? Where can I buy a Laser printer for that price?

: No, thats Intel/PC standard..

Which is what most people use. BTW ... Amigas and Atari ST's also
have industry standard ports.

He is a PC user actually. He practical made the damn thing himself.
He has a 486-33 and runs DOS, Windows, and Linux on it.

The reason why he doesn't have a laser printer is because he figures
why should he get one when he can use the department's printers.

BTW where the hell did you get the idea that Mac laser printers are
cheaper than PC ones?? THAT'S BULLSHIT!! Care to back that one up
with some facts and figures (like pointing out an ad in which a Brand
X printer costs $600 for PCs and $300 for Macs). I find it hard to
believe that Mac printers are cheaper than PC ones when Mac modems
cost 50% more than PC ones (for nearly the EXACT SAME MODEMS!).

1995.

And that is no longer a big problem (because Apple finally realized
that their price gouging was alienating hundreds of thousands of potential
and current customers) but sure was a big problem in the 1980's. Since
you haven't rebuked my accusation that Apple intentionally screwed Mac users
by effectively forcing them to by over-priced Apple printers in the 80's,
I take it that you agree with me on that. I guess that you have some
objectivity after all.

Font installation on an Atari works thesame way as in the case of the
Mac by dargging the font files to the fonts folder (NVDI3).

: What is a standard printer? Know you do not need extra hardware and software-
: what ever that means. You have no clue...

A standard printer is IMO one with centronics port, as most of the
printers have this port and no seriial port. This they cannot be
connected to a Mac wo. at leasta special cable, convererting serial to
parallel data flow (extra, more expensive hardware). This solution is,
however, soemwhat slow compared to real centronics. To use real
centronics you would have to install an interfacecard withthe port (which
I am sure of rella exists). As for the extra software, you do need - to
run these printer - the package called Power Print or so . This is by
definition extra software.

At least you admit the point aboutthe lack ofhardware documenmtation.

Regards,

Alfred

Standrad printer is one with acentronics port. As to the "outdated"
technologoy I do not know why I have to connect to s slower serial port
when I can have fast parallel port print out. As for the models with
multipole ports I agree with you. But you have to buy the drivers for
these printers in many cases extra (i.e. you have to buy power print),
and this is what I mean by extra software, which, more important,
resuluts in extra costs!

Well OK I just looked it up: it was July 1993 when someone suggested on
EMUSIC-L that firewire might replace MIDI. So replace "a few years" by
"nearly two years".

Well, I'm not a computer engineer -- I'm electrical, but the point is that
I *do* know how computers work -- probably moreso than the average Atari user,
not to mention the average Mac user.

>> >I like to be in complete control of the system, something the Mac does not

That's my point exactly -- editing ASSIGN.SYS files and so on accomplishes
the same thing as dragging fonts to a folder. Except dragging a font file
to a folder is easier to do and more easily understood by more people.
When you can perform the same action on machine A and machine B, but machine
B does it in a way that is easier, without losing any user control, which
would you say is the better way? Obviously machine B -- at least with respect
to that one operation.

You can patch the Mac OS with your own extensions and control panels. You
can look at Inside Macintosh and learn how the operating system works. You
can ftp MacsBug and debug to your heart's content. My point all along is that
just because the Mac is easy to use doesn't somehow limit its customizability.

Do you really have to understand how something works to be able to use it
productively? Millions of people use computers of all kinds every day without
knowing how they work. Billions of people use television sets, radios,
automobiles, telephones, and multitudes of other products without having any
idea how they work. Why should the computer be different? If someone wants
to be able to use a computer without having to understand what's going on
inside, are they somehow "stupid?" Do television repairmen think people
who use TV's without knowing how they work are stupid, the way so many
computer nerds think people who use computers without understanding them are

stupid?

>> If you want to change around the system, just get a copy of ResEdit, and you

You can alter the code in the System file with Resedit, if you want. Of course
you'd have to know machine language.

Er... are you refering to the sound output of the Falcon, which actually _is_ a standard Jack, or are you refering to the fact that the MSTe and TT has standard line output (not Jack), which is just another very well used standard? Or, since you write "MIDI" with capital letters - are you refering to the MIDI ports, which on all Atari computers comply with the standard for MIDI, a 5-pin circular DIN (not Jack), whereas the only difference between the ports on the Ataris and the actual standard for MIDI is that the MIDI through port has been assigned to two pins on the MIDI-out port rather than having its own port? For the last example, I can inform you that the sound blaster _definitely_ doesn't comply to this standard.

So in other words, you're complaint centers around the *concept* that if you want a low resolution dot matrix printer -- which is, in today's market, a very small niche printer for all but the oldest computers -- you need to invest an additional ~$90 in a converter (which, fyi, does not require custom software; the converter uses the standard Apple drivers). Never mind the fact, of course, that there are several quality dot matrix printers available for the Mac, most of which costing no more than a "comparable" PC-type impact printer. Furthermore, as I had previously stated in another message, the selection of mid- and high-end printers on the Mac is at least as broad (in all regards: price, performance, features, etc) as the PC-type counterparts.

We have a word in Norwegian for this: Museklikkemikkedille
In English, it would translate into something like "Mouseclickingflickingolism"
I'm one of those who actually like to use a CLI, even on my Atari.

> You can patch the Mac OS with your own extensions and control panels. You

Can you turn off the multitasking, but keep the operating system intact, too?
And, by the way. Just about all the software I use on my MSTe is free. With a
rather small exception, all the documentation I've got is for free. Remember.
I'm a student and therefore have little money. Besides, why should I buy some
overpriced equipment, when I get just about the same chipset cheaper when there
is an Atari label on it?

> Do you really have to understand how something works to be able to use it

Well, these billions of people are not electrical engineers, auto mechanic, telematic engineer... the billions of people you are refering to are end users. I'm, like, supposed to be a computer engineer. And like a car mechanic likes to have his own cool car of a mixed brand that he keeps in his garden to fix in his spare time, I have my computer that I alter both internally as well as externally. It might be an Atari computer now, but it will be a rather - eh - undecisive thing in the future. Even if it was a Mac, I'd be doing this, and it wouldn't be much of a Mac anymore. Except that doing this to my Atari is way cheaper, and I have no problems getting all the information I need for free.

> to be able to use a computer without having to understand what's going on
> inside, are they somehow "stupid?" Do television repairmen think people
> who use TV's without knowing how they work are stupid, the way so many
> computer nerds think people who use computers without understanding them are
> stupid?

I never claimed that Mac users were stupid. I just emphasized that the Mac was designed for the end users who have no intention of learning about the computer's internals. Just as I did with my comparison to my camera. Most people tend to be satisfied with a 35mm camera with two fixed positions of the zoom and no way to turn off the autofocus. These cameras are fully automatic and are designed for end users who have no idea of how a camera works. They just like to have these pictures shot, you know. A camera like that does not satisfy me, however. I like to turn off the autofocus. I like to be able to alter the shutter speed at will. I like to purposely over- or under-expose my films. That doesn't make the others stupid, it just shows that we are not out to do the same things. If I wasn't a computer engineer, and didn't have any interest at all in computers, I'd probably buy myself a Mac. Now, quite incidentially, I _am_ a computer engineer, and I have a rather high interest in computers, but I'm also a student, so I have little money. Having the need to create this custom computer of mine, but at the same time design this incredible operating system, the Atari was just as good a choice as any choice. And it was cheaper. And I could get the documentation.

> >I don't think ResEdit on System 7 will alter your system as much as

So ResEdit has a built in assembler? And don't worry, I speak fluently MC68k, Z80a, a little broken 80i386, and I communicate freely with MC6850 and MK68901 as well as a few other cool chips.

Why not do all this stuff on a Mac rather than an Atari? I guess you would have to show up in a European Atari coding party to understand that... oh, btw. It's been a long time since I was on something big. Last time I was on anything international was the Megaleif party in Uppsala - anyone know of any parties in the near future?

I'm sure glad Atari didn't make you use any "Adaptors" for SCSI, which I
think is much more important than a Printer. Now if you Really want to
talk about useing a "Non-Standard" Wintel Stuff, the MIDI Jack on the back
if the Ataris are also a not Standard. You have to have a sound Blaster to
have a Standard Midi Jack. (or so my Wintel Friends keep telling me!)

I seems that if you don't have a Wintel Machine you don't have a Standard
anything! At least that's what Uncle Bill Gates would like us to believe.

PS>No, thats Intel/PC standard..

Which *IS* the industry standard. If having over 80% of the market
doesn't make something an industry standard, then I don't know what
does.

Also, as has been pointed out, Ataris and Amigas ALSO use the parallel
port. Only Apple uses the serial port. The serial port is a Mac-specific
quirk. GET OVER IT!! (Sorry...couldn't resist)

PS>: Trauth@John half truths/lies.. I see you have a new address..

That's because they renamed the servers at Rutgers. If you look carefully,
you will see that .rutgers.edu is still in my address.

So no, Sincrap, Rutgers has not restricted my usenet privileges (as you
seem to be implying). In fact, my postmaster has never even mailed me
a warning or reprimand. It is only assholes like yourself who constantly
get in trouble with their sys. admins. and kicked off systems.

> And you have more addresses than Nintendo has lawsuits. I'm still
>trying to figure out why someone as rude and innapropriate as yourself
>can stay online. Tom speaks a lot more truth than you could ever hope to
>speak.

Way to tell him, Mark!

PS>: Well, I like the convenience of having my StyleWriter at my convenience..

> Yawn. Must be nice to be a rich, spoiled brat.

I don't know about rich, but he certainly is a spoiled brat.

PS>: Are we talking about PostScript printers? If so, than the Personal laserwriter
PS>: 320 for $895. I am sure Brand X may be cheaper, but not a name brand one..
>
> Apple is a "brand name?" Yawn. I would buy an Epson, Cannon, Star
>or Panasonic printer over those overpriced Apple printers any day.

I would even by a suspect fourth-tier cloner printer over an Apple one.

PS>: As for Modems, you are full of crap as usual..

How does stating the truth make me full of crap, Sinflop?

You obviously never read c.s.mac.advocacy. I have mean many posts there
where Mac users complain about how modem manufacturers screw Mac users
by charging them $150 for a modem that costs $95 for the PC.

> No, he's not.

Your damn right I'm not.

PS>: Apple charged what the market would pay.

Which was a lot since that market (Mac users) was captive. Ever
wonder how amusement parks can get away with charging over $20

for a substandard fast food meal that would cost $7 at Burger King.
It's because they have a captive market. You can either eat there
at the park's restaurants or go way out of your way to eat at a
normal one. Same goes for Mac printers when only one company
(Apple) is making them.

> Apple ripped customers off. Look at the rereleased IIc.

Quite right.

>Why should I care about what other people understand of my system? My system is
>for me, not for other people.

We're not talking about your system. We were talking about whether the Mac
is somehow "less powerful" because it's easier to use -- whether the fact that
it tries to be user-friendly somehow inhibits the user. I for one enjoy
going home and using a Mac, because it's such a contrast to the stupid Unix
boxes I use all day. It's wonderful not having to learn a whole new set of
commands for every program.

>We have a word in Norwegian for this: Museklikkemikkedille
>In English, it would translate into something like "Mouseclickingflickingolism"
>I'm one of those who actually like to use a CLI, even on my Atari.

Read "Tog on Interface" by Addison-Wesley. In many cases, users only THINK
they're faster with a keyboard than with a mouse. This is not to say,
however, that in some cases keyboard-based interfaces aren't more appropriate.

>Can you turn off the multitasking, but keep the operating system intact, too?
>And, by the way. Just about all the software I use on my MSTe is free. With a
>rather small exception, all the documentation I've got is for free. Remember.
>I'm a student and therefore have little money.

Are you trying to imply that there isn't much freeware or shareware for the
Mac? take a look at the UMich Mac archives or the Info-Mac archives, and tell
me there isn't tons of Mac freeware/shareware out there.

I don't know what you mean by getting "the same chipset cheaper."

>Well, these billions of people are not electrical engineers, auto mechanic,

>wouldn't be much of a Mac anymore. Except that doing this to my Atari is way
>cheaper, and I have no problems getting all the information I need for free.

No, whatever you do to a Mac, it's still a Mac. The premise behind everything
the user does is to allow the user to do what HE wants, not to force the

user to comply to the computer's wishes. That's the philosphy behind the Mac interface. Try reading the Macintosh Human Interface Guidlines and you'll see what I mean.

If you want to customize your Mac, you can customize it all you want. Lots of people out there have tons of extensions and control panels on their systems. Of course, if you want to customize your Mac with your own programs, you'll have to make the effort to learn Mac programming, just as you would with any other computer.

>to do the same things. If I wasn't a computer engineer, and didn't have any

: And you would have a right to initiate a lawsuit. What is the diffinition of
: nettiquette?

Yes. As for netiquette, your flaming in newsgroups is a violation
of that. Especially when some people have to pay to read your drivel.

: You mean the IIC+. As I recall, the price was $729.

I recall $1200.

: This is getting pointless. As I recall, Apple III owners had a upgrade option
: to the II. Apple IIe users could upgrade to the GS. Apple GS owners could
: use their Peripherals on the Mac. Mac LC users can install an Apple II card.

1) The III was supposed to be an upgrade from (not to) the Apple II.
2) IIGS owners could use their peripherals, but what about the
$3000 computer that went to waste?

: Did Atari provide upgrades for ST owners to the Mega STE, Mega ST, TT, and
: Falcon? The answer is no. Atari wanted their customers to buy new machiness..

Atari ST owners could upgrade their machines. Atari's Mega ST, TT
and Falcon were aimed at different markets.

: You must be lucky..The majority were less fortunate..

Right Peter. You've talked to every Atari owner out there, eh?

: Both hardly at all advertised to make a difference..

In Europe, they made a hell of a difference.

Source record: 13089

proche@isis (Pascal Roche) writes:

"
As a matter of fact, this is a well known problem of human-computer interaction.
Graphical point-and-click interfaces are known to be, of course, simpler to use
than CLIs and faster in simple operations, such as deleting a single file. CLIs
require more memory efforts but are more powerful because they include more
semantic differences. So deleting all m*.ba? files can be achieved faster
under a Unix shell than under Tos or MacOS. The problem is the same inside
applications: selecting a menu entry with the mouse is a simple but quite
"slow" operation, and this is the reason for the existence of "shortcut keys"
which do the same thing activated in a shorter time, but need to be memorized.
So it is obvious that graphical interfaces are destinated to "novice" users,
while CLIs are more appropriate for expert users. None of them is stupid. They
just have not exactly the same purposes.
"

I hate the "operation on files with a complex regular expression" example.
It is very easy/fast to delete all the files in a directory or on a disk
with such an expression using the Macintosh GUI. Also the speed of an
operation is not completely dependant on the physical time it takes to
do an action. Thinking about how to delete all the files created on tuesday,
modified on wednessday, having exactly one x in their name, starting with
Lib and ending with .c would probably take longer to do under unix than
the mac GUI since I (personally) would have to think about doing it
under unix while I could immediately start issuing commands on the mac.
Note that Software Engineering 4th Edition specifically recommends using
a GUI when your target users are experts in the field that your application
was designed for REGARDLESS of their computer expertese.

Sinclair,
Just admit that you were wrong about the Stylewriter. Just because it suits your needs does not make it a laser printer. Aren't you the person who always claims that Atari makes false claims? Didn't you also use the saying "pot.... kettle.... black" a little while ago? Do you see something wrong with this picture?
BTW, I got my Canon BJ-5 inkjet for $165. Yippee! My friend had the same printer before he bought a Mac and was forced to get a new printer.

sinclap2954@cobra.uni.edu wrote:
: Well, I like the convenience of having my StyleWriter at my convenience..
Well, at the university here we have both style writers attached to Macs
and their absolut equivalent, the Canon BJ printers. The Mac users are
alaways complaining about the speedo of the pront out usind their
serial port and are astouned to see, how much faster priniting works with
the same printer but using a centronics port.

: Apple charged what the market would pay. Apple did not screw their customers.
: pple provided a lot of support unlike the defunct C= and computer less Atari.
: As we call it, competing on the cheap does not cut it..

On the cost side, it cuts it all the way. If I were to buy a Macintosh in
the 80s, I would have had to pay four times as much as for the better
Atari Machine (which had, above all,a nornmal display and no postcard
joke). I would have had problems to read PC disks, because "super drive"
technology was nit available (yik, Apple alaways succeeds in making
trivialities sound like enormous innovations).

Nowaadays, these machines are as outdated as their Atari counterparts of
that time; lots of software doesn't run practically (because of speed and
memory limits any more there). So youv have to upgrade - like Atari users
have to. A power Pc maybe- but then the old applications run in emulation
mode. And for the Atari users? He also can upgrade to a Mac, because the
whole operating system is ported to support Macintosh hardware (BTW, the
Atari operating system is WAY faster on the Mac than the Mac operrating
sysdtem). So where is the advanatage? people paid more in the past and
have the same result as the Atari users nowadays. That's how Apple became
the Yuppie machines, because it needs - let's say- special people to pay
more for the same result *AND* support. (becvause the support of the
Atari operating system and software - now called Magic- is second to none!).
.

Regards,

Alfred

>look in some old Amiga or ST magazines.

Yuck. Have you seen the Atari developer's kit? I have one. It's pathetic.

> I have some Atari and Commodore commercials on tape.

One of the big complaints against Atari was always that it never advertised
the ST enough.

Sorry, but saying that something happened doesn't change history!

They're not standard. In the original ST (I don't know about the Falcon,
but it's probably the same) Atari combined the MIDI OUT and MIDI THRU ports,
making them non-standard. If I remember correctly, it caused problems, but
only with a very small number of products.

Actually, one of the things I _like_ about Unix is the power there is in each command. Put them together the right way, and you'll discover the power. Hey! I even wrote a newsreader in bash, once!
I'll get back to the user-friendliness below.

> Read "Tog on Interface" by Addison-Wesley. In many cases, users only THINK
> they're faster with a keyboard than with a mouse. This is not to say,
> however, that in some cases keyboard-based interfaces aren't more appropriate.

Of course, there is nothing you can do with a CLI that you can't represent graphically. Also, there is nothing you can represent graphically that can't be done in a CLI. There are two places we should measure the "power" - the user interface's communication with the user, and what happens between the user interface and the hardware. As to which user interface is the most powerful, it depends more on the user than anything else. I use a graphical interface every day: X-windows. I run Netscape in it, and several shell windows. That is what I call a nice and comfortable combination. I do not use a graphical file manager simply because it just doesn't work efficiently enough for me, and it's "too messy" to work with...

> Are you trying to imply that there isn't much freeware or shareware for the
> Mac? take a look at the UMich Mac archives or the Info-Mac archives, and tell

I find it hard to believe that you are able to get free/shareware assemblers and other utilities that are as well done as the ones I find for TOS.

> I don't know what you mean by getting "the same chipset cheaper."

Both the Atari TOS computers and Apple Mac computers basically run on an MC68k for a main processor. Actually, only three things seperate these computers:
1) The label and the casing
2) The default (built in) chipset that interfaces to the CPU

3) The Operating System

> No, whatever you do to a Mac, it's still a Mac. The premise behind everything
> the user does is to allow the user to do what HE wants, not to force the

Ok, so if I rip out the default supplamentary chipset and insert the default chipset of an Atari, and put in new ROMs with Atari TOS on it, making the computer fully Atari compatible and Mac incompatible, it's still a Mac? I suppose I already have a Mac, then, so what are we arguing about?

> user to comply to the computer's wishes. That's the philosphy behind the
> Mac interface. Try reading the Macintosh Human Interface Guidlines and you'll
> see what I mean.

I must admit that I haven't had the chance to use a Mac an awfully lot, but imagine I want the following setup: The active window is the window under the mouse pointer, even if this windows shouldn't be the one on top. I want a private colormap for each window, and want some virtual screen displays so that I get a lot larger desktop than can be displayed on the screen. Since I want to just click in a window to move directly to a specific part of the virtual screen, I want a virtual screen manager window in the top left corner of my screen. And I want it to be sticky, and stay there, no matter where I move. I want to be able to click inside a window without topping it. And I want a menu to pop up when I'm clicking outside any windows. And this menu should be user defined with sub-menus and sub-sub-menus. And I want it to pop up every time I press F9. Can I do that under MacOS? Actually, GEM isn't all that nice, either, I'm just telling you how my setup is under X-windows.

> I am a student, and I also don't have much money. I was able to get a good
> deal on my Mac from my University bookstore. Perhaps it's different in
> Europe.

I could say it's different in Norway... A Norwegian student can't afford to just go ahead and buy a computer, it make almost half a year of his student loan just for a PC, and the Macs are even more expensive...

About Mac's userfriendliness:
a) The Operating System takes up way too many resources. It is possible to get the same user-friendliness without using the same amount of resources, thus getting a more efficient system.
b) It bases itself on having only one button on the mouse. I find using systems with two or three buttons a lot more efficient.

And actually - did you know that MacOS actually is based on an outdated version of UNIX? What you don't like about the "stupid" Unix boxes is not the actual Unix system, but you just don't like the CLI. Well, what do you know - there is a GUI for Unix, too. My point: There is a difference between user interface and operating system, there is a difference between operating system and hardware. Strip the OS off a Mac and an Atari, and the hardware is basically the same.

Blah blah, yet another model of mac, two words, blow me... You know, a lot of
mac owners, myself included, are pretty pissed at the inability to upgrade
our machines to use PowerPCs... My poor little powerbook 180 is <2 years
old and it's a dead machine as far as Apple is concerned... Now look,
another model!!! Just what we all need... So how many disparate models
of mac are there now? I'd love to buy a Power PC but I'll be damned if
I'll touch an Apple machine until they've stabilized. They'll probably
release an upgraded Pippin 6 months into release in a desperate attempt
to speed it up...

> Apple's Pippin Power Player (cool looking unit), SRP $500 has alot

I wonder why Apple hasn't asked Nolan Bushnell for an opinion on this
thing... C D T V all over again... Now we all know how Apple managed to shrink
from #1 to 1/10 of the computer market... Watch them top this performance with
the Pippin... If you liked Newton, you'll LOVE Pippin...

Never mind his statement. Sinflop just displays his total lack of
knowledge. The two printers he named are both inkjet printers, *NOT*
lasers. If we allow such sloppy definitions, what about the 200$
`laserprinter' for the Atari (Olivetti JW-150), or even cheaper :-)

> The Parellel port takes up huge Real estate on the mother

God, Sinflop, you *ARE* clueless. A Centronix interface is about the
simplest thing you can imagine for a computer system. *One* simple
PIO would do the job.

> It also alienates Apple from Industry Standards.

Well, we'll have to admit that Atari made some non-standard choices
too... :-)

As a matter of fact, this is a well known problem of human-computer interaction.
Graphical point-and-click interfaces are known to be, of course, simpler to use
than CLIs and faster in simple operations, such as deleting a single file. CLIs
require more memory efforts but are more powerful because they include more
semantic differences. So deleting all m*.ba? files can be achieved faster under a
Unix shell than under Tos or MacOS. The problem is the same inside applications:
selecting a menu entry with the mouse is a simple but quite "slow" operation, and
this is the reason for the existence of "shortcut keys" which do the same thing
activated in a shorter time, but need to be memorized.
So it is obvious that graphical interfaces are destinated to "novice" users,
while CLIs are more appropriate for expert users. None of them is stupid. They
just have not exactly the same purposes.

Pascal.

This is getting pointless. As I recall, Apple III owners had a upgrade option to the II. Apple IIe users could upgrade to the GS. Apple GS owners could use their Peripherals on the Mac. Mac LC users can install an Apple II card.

At least apple had provides some sort of options..

Did Atari provide upgrades for ST owners to the Mega STE, Mega ST, TT, and Falcon? The answer is no. Atari wanted their customers to buy new machiness..

: I'm sorry, but that is *not* true. Atari never had a trade-up program
: for XL/XE owners.

Wanna bet? Atari Canada allowed Canadian customers to trade any
base console, any condition for a 520ST. You are wrong. Sorry.

: Yuck. Have you seen the Atari developer's kit? I have one. It's pathetic.

What is so pathetic about it? Atari Canada was always heavily
involved with Atari's user groups in the Ottawa area and provided ST
hardware at super high discounts for developers.

: One of the big complaints against Atari was always that it never advertised
: the ST enough.

Fair enough. But to say that Atari *NEVER EVER* advertised any of
their products is BS.

I just got some preliminary specs and pictures of the high-end PCI
Power Mac 9400/120 (code-named Tsunami). It will have 120MHz PPC 604 (604
can be pulled and a faster PPC inserted), 6 PCI slots, 12 DIMM slots, Async
DMA FAST SCSI-2, Quad-Speed CD-ROM, AAUI, 10BASE T (ethernet), 2 serial
ports, ADB port, 16bit sound I/O ports, Surfer Risc based 32bit Video
display card. YARC has announced it's Screamer GLINT based accelerator
for modeling and rendering, Matrox has a 64-bit QuickDraw 3D accelerator as
well as 3D labs.

Apple's Pippin Power Player (cool looking unit), SRP $500 has alot
of cool features. It will have a 66MHz PPC 603, 4MB ROM, 6MB Ram, 1 SIMM
slot, ADB port, 16bit sound I/O ports, GeoPort, 1 PCI slot, 16bit color,
support for S-VHS, Composite and regular monitors, and a quad Speed CD-ROM.
It will also feature a new native high speed 680x0 emulator, Native

Quickdraw, and QuickTime 2.0. Options will include a floppy drive,
keyboard, mice, MPEG. UP to 4 players can be hooked up at once for
'Network' play.

I also have an indepth article on QuickDraw 3D that was in this
months 3D artist (no more Amiga coverage).

I'll scan the articles and print them out and mail them to you.

That maybe right. But if I'm changing the platform (perhaps to Mac), I _don't_
want to have to buy all stuff new. I want to use the at least the old monitor
and the old printer. The most old printers are Centronics !

But the thing is, that most people who use Macs have to buy a printer from
Apple (or believe that they must do, because the most stores here only offers
PC-stuff). So they _must_ tolerate a higher price. That might be capitalism but
it isn't good for the people, to buy stuff that is more expensive than it have
to be.

You are right, if you are saying that Atari support for hardware repairs etc.
is and was not good. But here there are many third party companies which gives
us a very good support.

Why don't let the user the choice between Laser, Inkjet, or Dot-Matrix ?

: > I think the basic problem here is Sinflop can't tell the difference
: > between a laser printer and an inkjet printer.

: Can't tell the difference, quality wise..

That's not difficult. The pixel on a inkjet is always bigger than on a Laser.
And that's important. Compare a test print on a Laser with 600 dpi, a Laser
with 300 dpi and a Inkjet with 300 dpi. The Laser print is always charper,
even if you are using a 300 dpi font at all of them (The 600 dpi printer
with 300 dpi font produces even a charper print than the 300 dpi Laser).

: I'm sure glad Atari didn't make you use any "Adaptors" for SCSI, which I
: think is much more important than a Printer. Now if you Really want to
: talk about useing a "Non-Standard" Wintel Stuff, the MIDI Jack on the back
: if the Ataris are also a not Standard. You have to have a sound Blaster to
: have a Standard Midi Jack. (or so my Wintel Friends keep telling me!)

Of course the early STs had some pecularities, such as the need of a Host
adapater to connect to SCSI hardware. But -in contrast to Apple - Atari
lerned of their mistakes and included standrad SCSI port (TT) and SCSI II
port (Falcon) with their newer computers. The MIDI ports are absolutely
standard. You won't find any NIDI device that won't connect with normal
MIDI cables to the Atari (The MIDI through port is dispensible in that case).
BTW, in contrast to Apple, all Ataris SCSI and ACSI ports have DMA
access, an innovation Apple just managed to introduce only 2 years ago.

: I seems that if you don't have a Wintel Machine you don't have a Standard
: anything! At least that's what Uncle Bill Gates would like us to believe.

That is not true IMO. But if I see hundreds of printers and do need extra
effortsto connect it to just a special platform, while *ALL* other
platforms (Atari, Amiga, Wintel, Workstations, Acorn....) support it
unseen, than there is something seriously wrong with that secial platform.

Regards,

Alfred

: to do the same things. If I wasn't a computer engineer, and didn't have any
: interest at all in computers, I'd probably buy myself a Mac. Now, quite
: incidentially, I _am_ a computer engineer, and I have a rather high interest in
: computers, but I'm also a student, so I have little money. Having the need to
: create this custom computer of mine, but at the same time design this
: incredible operating system, the Atari was just as good a choice as any choice.
: And it was cheaper. And I could get the documentation.

EXCELLENT comparison. This is what amkes the difference between a
professional computer platform and anything else. The lack of hardware
documentation on the MAC make ceratin innovations on this platform
virtually impossible. The Mac is more or less a censored platform. You
are allowed to program onlywhat Apple approves. Just look at the problems
of porting Linux to the Mac. If the Mac would be industry standrad -
which will never happen because of that reason- it would mean a step
backwards in computer development, more, IMO, than using Intel machines.
And when it comes to the operating system side, there is virtually
nothing the MacOS can do that Ataris OS won't do. As is described before,
on an Atari you also can drag fonts to a font folder and hereby install them.

Let us wait for the CHRP machines. Then there will be proper hardware
documentation, and then we will see wether MacOS can live up to NeXT
Step, Workplace OS and the liks.
Regards,

Alfred

What a load of crap. Macs have NuBus slots. Those that don't have NuBus slots have PDS slots. You can design any card you want and plug it into the slots in your Macs. The documentation is available.

Just because you aren't forced to solder stuff onto the motherboard because of a lack of slots, or reverse engineer Apple's chips because they don't provide an upgrade method (like Atari, for a *long* time!) doesn't mean the Mac can't be upgraded.

> You
>are allowed to program only what Apple approves.

That's also a blatant lie. The Inside Macintosh series, a HUGE collection of books published by Apple about its OS, is readily available to anyone who wants to learn how to program on the Mac. How could you be allowed to program "only what Apple approves?" How could Apple possibly control what programs programmers write? Your statement makes no sense whatsoever.

>And when it comes to the operating system side, there is virtually
>nothing the MacOS can do that Ataris OS won't do. As is described before,
>on an Atari you also can drag fonts to a font folder and hereby install them.

Sorry, but the Atari OS *can't* do that. Someone already said in this group that that's a function of NVDI. Once you add third-party (extra cost, I might add!) utilities you are no longer talking about the base OS. If you want to be allowed to add third party utilities to the Atari and claim them as Atari OS features, then I can do the same to my Mac, and the Mac will still come out ahead compared to the Atari in terms of OS features.

>Let us wait for the CHRP machines. Then there will be proper hardware
>documentation, and then we will see wether MacOS can live up to NeXT
>Step, Workplace OS and the liks.

This really annoys me. Do you have *any* clue what you're talking about? "No hardware documentation?" Look - if you want to use an Atari, fine. I don't rcare what you use. Just don't spread lies about the Mac, ok? I'm not here to convert you, I'm here trying to correct all the misinformation being posted in this group.

Yes, and this applies to other CLIs, such as Unix shell, which are subject to nasty syntax errors. Have you ever seen the effect of a "rm *;o" when you meant "rm *.o", ending with a strange message "o: command not found" before you discover that you have just deleted all your files ? Usually, this happens only once, because next time you'll use "alias rm rm -i". That kind of mistake can't happen with a graphical interface. On the other hand, I'm tired of being forced to select several times a big bunch of files on my Atari when I want to delete all the files on a disk, just because the files don't fit in a single window. I'm sure that graphical interfaces could be more powerful than the actual ones. I wish I had the brain directly connected to the machine. Maybe one day...

The problem you describe -- not being able to select all files on the disk at
once, and being forced to select several times -- is caused by your particular
GUI. It has nothing to do with GUIs in general. Other GUIs get around this
by either scrolling the window if you drag a selection to the window's borders
or by providing a "Select All" command.

Why is the pippin considered a CDTV? I remember that the CDTV first sold for
$999, while the Pippin starts at $500 list($400 street?). I wonder if Atari
should of talked to Nolan.

Actually, you can hit "x" to file mask to M*.ba?, then delete all items
in the window. Point still understood and agreeed with, tho... :)

What can I tell you. Wait...According to the Apple Game evangilest, the Pippin
will be heavly marketed outside of the U.S. Most likely will be aggressively
priced. But, time will tell.

Like "Select all items" on TOS 2.0+... Now, if the mac had a way to set a file
mask for a window... that would be a help... Of course, then it'd have to
do "nastly" things like have wildcards & reasonable filenaming conventions.
Any OS that allows spaces in filenames has one good strike against it
already...

Well, in terms of file selecting, the Mac is even worse than the ROM file
select box of the Atari.

You can download each font you need to use in each size that you will use
it -- the postscript driver in CS-TeX does this. It also uses postscript
commands to achieve correct kerning.

As a result a 2-page article generates a 60 KB .PS file, but the output
is extremely nice. MS Word for Mac generated 750 KB, and I can't tell
you what it looks like because it crashes our office printer.

Simply select "view by kind" from the View menu. Then all files of the same
type will be grouped together for easy deletion. This also has the benefit
that files don't disappear from the window.

Heaven forbid that an operating system should allow users to name files the
way they want, as opposed to forcing the user to name files the way the
computer wants!

Maybe. But that is not the point. You always say, "Mac is the best, Atari
sucks, no support...", but that's _not_ right for the whole world. Usenet
is _not_ only for US-market.

Source record: 13127

: That was the price of the original IIc in 1984. The IIC+, I believe came out
: in the late 80's.

It did. Compute! ran several letters from pissed off customers
who complained about Apple's gall in pricing the obsolete machine at
$1200.

: It did not turn out that way due to the popularity of the IIe and bugs in the
: III.

And Apple quickly dropped it.

: The IIGS alone costed $999 and less. The keyboard, the drive and ImageWriter
: could be hooked upto the Mac..

Peter ... the IIGS was a $3000 machine. Perhaps it fell when it
was discontinued, but it sure wasn't under $1000 during it's intended heyday.

: And what was that? And I could say that about the II at the time..

The 1040ST was intended for home, the Megas were aimed at
business, the TT was supposed to be a high-end business/desktop
publishing machine, the Falcon was a replacement for the 1040ST.

: Until the Amiga 500 came along...

Yes you are correct. However, the Mac did little to hurt Atari in
Europe.

Markus Soick (markuss@power.techem.ruhr-uni-bochum.de) wrote:
: That maybe right. But if I'm changing the platform (perhaps to Mac), I _don't_
: want to have to buy all stuff new. I want to use the at least the old monitor
: and the old printer. The most old printers are Centronics !

The key word here is "OLD". There comes a time, Markus, when you HAVE to move up in the world. If we didn't, we'd still be running 40-column 6502 machines with 9-pin dot matrix printers and composite color monitors. This is the 90's; it's time to move on.

Though you DO have a point, though you obviously haven't thought it through far enough. Let's say, for sake of argument, that you have a PC and a decent printer (inkjet or laser) and you want to go to Macintosh. What do you do? As you said, you could sell your old and get a new printer, but that would be a significant loss of dollars. Not good. You could, with little difficulty, invest in a ~$90 package and connect the printer right up - no harm done, and you'd be spending a lot less than you would have lost if you did the sell-old/buy-new route. But if you thought ahead when you were purchasing your equipment to begin with, chances are you would have bought a multi-port machine which would connect to either machine. If you didn't do that and happen to have a Hewlett-Packard printer, they do offer a trade/exchange program where you can exchange (for example) your DeskJet and a nominal fee (don't know what it is, but it's not that much) for a DeskWriter, or vice-versa.

In essence...This whole "Apple screws you with peripherals" thing is just not true. There's many, many choices out there. Apple hasn't been the sole hardware manufacturer for YEARS. Most mid- and high-end printers these days (and for the past year or two) have supported both platforms out of the box. Unless you have an old Gemini 10X from 1984 you want to plug into your Mac without worrying about Thing One, you shouldn't have much problem.

Pete,
What wrong statements have I made about the Mac? Please point them out to me when I make them. And, no, my believing that the Atari Falcon is much more fun to use than a Mac is not _wrong_ but is a subjective opinion. And I do try to use "IMHO" when I am stating my own opinion.

Public Enemy #1, sinclap2954@cobra.uni.edu speaks:

>> I've checked. Laser printers do not go for under $300. You must
>> mean Inkjet printers.

>Yes, inkjet printers. Are as good for text printing too.

Try telling that to a professional publishing house..

True, you can get high print quality from an inkjet printer, print
quality that is (I will admit) probably good enough for most users
(so long as they don't have to print out resemes, that is)

But inkjet print quality definitely isn't as good as laser print
quality. I know. I closely compared the two when I bought decided
to buy new printer last year (because I had come to the conclusion
that my 6-year-old Panasonic dot-matrix printer could no longer cut
the mustard). And from those comparisons, I quickly came to the
conclusion that the print quality of laser was superior; its output
was clearer and less smudgy than inkjet output. Thus, I decided to
buy a laser printer, even though they cost twice as much.

In short, your claim that inkjet printers are as good for text as
laser printers is bullshit!

Also, you said that you could get $300 "laser printers" for the Mac,
not that you could get $300 "inkjet printers that are as good as
laser printers" for them. You made a mistake. Admit it! Then
GET OVER IT!!

Not nearly the same thing...
You think we don't have view by type? The advantage is that by setting
a file mask, I can quickly hit "E" (select all) and do a mass operation on
those files.

>Heaven forbid that an operating system should allow users to name files the
>way they want, as opposed to forcing the user to name files the way the
>computer wants!

You're right. The OS should allow anything. Like naming all your files
"fred" Why should we have any organization to our drives? If the user wants
to call everyhting fred, the OS should allow it. Now, I'm all for user power,
but when I go to use a mac and I see filenames like "Billy's Second story part
three" I get nauseous.

Markus Soick (markuss@power.techem.ruhr-uni-bochum.de) wrote:
: Why don't let the user the choice between Laser, Inkjet, or Dot-Matrix ?

The user DOES have the choice. So what's your problem? There's dozens of printers of all varieties available from many manufacturers. Dot matrix printers aren't very high-profile in the Mac community simply because inkjet printers produce better quality output for less money (not to mention taking less space, quieter operation, etc).

: The diff is, that I want to make the decision what to use, not the company for
: me.

So head over to the PC world. You should have tons of fun figuring out the dozens of so-called "standards" over there - should give you all the choices you want. Example: On the Mac, you don't have to worry about what kind of video you have when buying a program. Does that apply on the PC? Nope. You've got DOZENS of "standards" to choose from. So choose away! That's what the PC world is all about.

When you're done choosing your life away, take a step back and think about this: Consider how many difficulties there are with incompatible hardware/software in the PC world. Compare that with similar statistics in the Mac world. HUGE difference. Now you know why the decision is made "for you". Personally, I rather like buying a printer (or whatever) and not having to worry about whether or not I have a certain type of card, or certain type of connector, or whatever. I _know_ I have it, and I know it'll work without a problem.

David,
Regarding fonts on the Atari, there is a new program out called
SpeedoGDOS. It comes free with Falcons purchased with a hard drive.
It has a simple program that allows users to choose the fonts they
want installed. No more with editing assign.sys files. This is
an _Atari_ replacement for GDOS so I think this should be how the
Atari's font management is judged. The newest version of Speedo
also allows True Type fonts to be used.

Steve G.,
What is wrong with old hardware if it serves the user's needs?
The description you gave (6502, composite monitor, 40 column screen)
sounds very similar to an Atari 8-bit which could serve the needs
of most home users. A bit of word processing, spreadsheets and games
are all done fine. And the 8-bit costs very little as well as beating
a Macintosh in games anyday (IMHO).
All I am saying is that people shouldn't feel forced to buy new
hardware just to keep up. This is a problem in the computer market
today IMO.

>but when I go to use a mac and I see filenames like "Billy's Second story part
>three" I get nauseous.

Oh, I see... When the Mac lets the user do something that the Atari can't do,
the Atari advocates say "The Mac shouldn't allow users to do that, because
<insert some lame reason>." When the Mac can't do something, or when it
prevents the user from doing something that's impossible, the Atari advocates
says "See, that's just another example of how the Mac tells the users to do
things the way it wants instead of allowing them to do what they want."

So what do you want -- do you want the computer to control you, or do you want
to control the computer? If the Mac didn't let users put spaces in filenames,
no doubt it would be used by Atari advocates as an example of how restrictive
they think the Mac is.

Where are you getting that price? If I wanted to, I could go to the bookstore and buy the Inside Macintosh series (*all* of the books) for about $400 Canadian. That's COMPLETE documentation on the Mac OS. If you want, you can also ftp them from ftp.info.apple.com for no cost at all.

Once again, I have no idea where this file selector comment came from. I have no problem with the Mac file selector box, but then again I never found anything wrong with the TOS 1.4 selector box either. I never felt the need to put a whole bunch of strange functions in my file selector. In any case, the Finder is a click away if you need file management.

Of course, the power of a real OS like unix is that you can easily override
the conventions such as the above. However, the fact is that without
specifically telling the computer "I'm using quotes, so I know that it's an
illegal filename, but use it anyway" Unix does not allow spaces. Hey, I've
seen illegal characters used on STs and PCs too. It's just a bit harder.

: What a load of crap. Macs have NuBus slots. Those that don't have NuBus
: slots have PDS slots. You can design any card you want and plug it into the
: slots in your Macs. The documentation is available.

Yes, if you want to design extra hardware for the Mac, then there is the
posiibility of interfacing it, right. But you miss the point about
"hardware documentation", that is, a full documentation of all of the
systems chips, their rgeisters, timing etc. Is there a hardware
documentation of the I/O ports of the Mac, serial interfaces, SCSI
interfaces? Did you ever care to ask people who really tried to get hold
of that information for their programming ourpoes? I guess not; you are
one of that Macians who think just because Apple provides a hardware docu
for their PDS and NuBUs slots and hundreds of pages abou their MacOS that
this makes a full hardware docu.

: Just because you aren't forced to solder stuff onto the motherboard because
: of a lack of slots, or reverse engineer Apple's chips because they don't
: provide an upgrade method (like Atari, for a *long* time!) doesn't mean the
: Mac can't be upgraded.

Again, you miss the point. It is not about a hardware upgrade, but about
the possibility to acces Macintosh Motherboard hardware directly, wo.
using MacOS. Period. As for the hardware upgrades with Atari and Mac, I
have to say that there are Macs (such as Mac Classic, Mac Plus) that do
not seem that easily upgradeable to myself and at the same time Atari
computers also provide for a PDS slot (Falcon, Mega ST) or VME board
(Mega Ste, TT) and multiple boards either (Eagle, Medusa). But let's get
back to the subject, because the important stuff followos directly:

: > You
: >are allowed to program only what Apple approves.
: That's also a blatant lie. The Inside Macintosh series, a HUGE collection
: of books published by Apple about its OS, is readily available to anyone who
: wants to learn how to program on the Mac. How could you be allowed to
: program "only what Apple approves?" How could Apple possibly control what
: programs programmers write?

How? TRY TO WRITE AN OPERATING SYSTEM FOR MACS, for example. Good luck.
You know how many people would like to see Linux ported to the Mac? have
you ever read the Linux- MAC FAQ? How theses people stand there night by
night using hacker techniques to get at least SOME information on how the
Mac hardware works, wo. proper sucess till ,now, BTW? Do you know of any
operating system other than MacOS that runs on the Mac NATIVE, that is,
wo. being a MacOS application and not written by Apple? THERE IS NONE,
because Apple doesn't allow
for it. That is how Apple controls what programmers write, you are, using
that example, only allowed to program MacOS applications. What if people
would need operating systems for real time purposes (RTOS- Pearl)? Are we
going then to use Bubble help to sort these problems out? ;-)

: >And when it comes to the operating system side, there is virtually
: >nothing the MacOS can do that Ataris OS won't do. As is described before,
: >on an Atari you also can drag fonts to a font folder and hereby install them.

: Sorry, but the Atari OS *can't* do that. Someone already said in this group
: that that's a function of NVDI. Once you add third-party (extra cost, I might
: add!) utilities you are no longer talking about the base OS. If you want to
: be allowed to add third party utilities to the Atari and claim them as Atari
: OS features, then I can do the same to my Mac, and the Mac will still come
: out ahead compared to the Atari in terms of OS features.

I admit that NVDI is not part of the base OS. But if I would have had
boughta Mac Plus or a Mac Se/30 at its time, System 7 would also not be
part of the base OS. I would have to upgrade, and that is the same case
as with Atari. From time to time it is not bad to pay money for improved
OS versions. Let me also make clear, that NVDI is not a "utility", such
as a control panel expansion, but a replacement for a part of the
operating system. As Atari themselves do not make any more upgrades, the
upgrades are done by other companies, replacing the operating system
itsself. Thus, the upgrade path is the one leading to NVDI and Magic (the
complete TOS replacement), the same path as NacUsers from System 6 to
System 7. This is possible, because there exists hardware documentation,
that allows programmers to develop operating systems on their own. Take
NVDI for example. The NVDI replaces the old Atari VDI and GDOS, which are
the counterpart of Quickdraw on the Mac. There can never be, hoever, a
replacement for Quickdraw done by other companies, because of lack of
hardware documentation.
Now, mybe if we add up all system extension and utilities, Mac OS will
probably come ut to have more features (especially in the network area);
however, when it comes to speed and usability, you'll never get to NVDI
and Magic.

: >Let us wait for the CHRP machines. Then there will be proper hardware
: >documentation, and then we will see wether MacOS can live up to NeXT
: >Step, Workplace OS and the liks.

: This really annoys me. Do you have *any* clue what you're talking about?
: "No hardware documentation?" Look - if you want to use an Atari, fine. I
: don't rcare what you use. Just don't spread lies about the Mac, ok? I'm not
: here to convert you, I'm here trying to correct all the misinformation being

: posted in this group.

Lies? Hopefully I got my points right in the paragraphs above. It seems
to me, that you are somehow a victim of Apples excellent marketing
campaigns, a mirror reflecting all the ads. Let me say that I am using
Macs a lot (right now I am writinh that message on a Mac IIcx), as I do
Ataris and PCs. And compared to both, the Macintosh platforms has
its good points, but also its serious flaws, that, IMO, are responsible
for the succes of the Intel machines despite excellent support and
marketing done by Apple.

-----Sidenote:
The problem (hardware docu)encountered the Atari world again, after Linux
Mac, with teh portation of the
Atari operating system to the Mac. It was not possible to write Magic Mac
stand alone; instead it had to be a Macintosh application. This had
advantages (using Mac and Atari soft parallel, usage of network and CDROM
functions directlx from MacOS), but resulted in also some problems,
especially regarding the I/O part (printing is much slower, and the
programmer of the I/O drivers told of serious bugs in teh Mac OS) - this
problem can be fixed by adding a PDS card with te specific I/O ports
which could be adressed by the drivers directly. Moreover, one had to
disable preemtive multitasking, which is a serious drawback. They found
however a way to implement NVDI and thus omitt the slow Quickdraw routines.
But still- a native Magic for Macintosh hardware m#would mean, IMO,
dramatic performance increases.

Regards,

Alfred

BAck and forth, back and forth... Funny I never see any MAc OR Atari users in an Amiga group atacking that machine.

I own all the above machines, and as far as the MAC-ATARI debate, in the low end machines, for expandability and price-performance, the ATARI is clearly the winner...

I recently did a comparison (unbiased and objective) between ATARI-MAC, ATARI-AMIGA, MAC-AMIGA. One thing we have to remember is that if you compare a 520ST to a Quadra 950 the Mac is going to come out on top, no problem. BUT, if you compare the machine's in the same Processor group and time frame, i.e. a 520ST to a Mac 512K or even a MAC Plus, then it's fair, and the ATARI is clearly the winner.

But who really cares??? What are Macians doing in an Atari group anyway? That's why they have their own groups.

One more thing.... I don't have a Falcon to test against a late model Mac, so no comparison info on those... sorry....

I am aware of SpeedoGDOS. The last version of GDOS I used was FSM/GDOS,
which was an improvement over Atari's GDOS 1.1, but was still awkward.
Fonts were installed in FSM/GDOS with a control panel, and the user chose
default sizes, the cache size and so on. It still wasn't as easy as
drag-and-drop to install new fonts.

I've been told in this group that SpeedoGDOS also doesn't have drag-and-drop
installation of fonts; apparently that's a function of NVDI.

In hardware? Why in the world would anyone want or need to do that, when
there are slots aviailable? The need to solder stuff onto the motherboard
is a relic from the days when closed systems were the norm.

Re: your point about there not being another OS for the Mac. The MacOS
is what defines the Mac -- it's why people buy Macintoshes. If people want
something else, they'll buy another machine. In any case, this entire point
will be moot when CHRP comes out.

>hardware documentation.

First of all, control panels and extensions on the Mac do exactly the same thing as AUTO programs do on the Atari - patch portions of the OS. There are programs out there, such as RamDoubler, the various compression utilities, and a whole lot of other stuff, which patch the OS.

Anyone could replace Quickdraw if they wanted, but there is no need to, for two reasons: (a) Quickdraw runs fast enough for all but the most demanding people and (b) those who need very fast performance usually get video cards with Quickdraw accelerators.

>Now, mybe if we add up all system extension and utilities, Mac OS will
>probably come ut to have more features (especially in the network area);

Tell me more about Magic. I'm not familiar with it.

The HP "M" printers typically have multiple ports (M is for Multiple, not Macintosh) that support mixed-platform environments. The HM 4V/4MV is a good example.

Furthermore, contrary to your incorrect assumption, Macs can indeed use non-PostScript printers. I have a DeskWriter 550C attached to my Mac, and that is not PostScript.

There was infact a replacement of Quickdraw written. It replaced most of
Apple's ROM routines and added a few of it's own. I was on the market for
a while (I think the name was "QuickerDraw") but eventually Apple just
bought it. One reason people don't bother to rewrite Quickdraw routines
is because they are very fast for what they do. For example, CopyBits, the
standard Mac "take these bits and put them here operation" is slower than
the custom routines that most game programmers use. But most game programmers
don't check the depth of the target device, check to make sure the bits
are word aligned, make sure the bits are clipped inside a window, etc. No one
that I know has made a better version.

Markus Soick (markuss@power.techem.ruhr-uni-bochum.de) wrote:
: Postscript give us not the best quality of printing, because it is better to
: use a font, which is corrected by hand for every resolution and height. There
: is only the same quality, if you send the whole text in a graphics picture,
: but then there is no advantage from Postscript about direct access.

I don't quite follow your language here, but I *think* I know what you're referring to. Correct me if I'm wrong.

You're saying that PostScript doesn't give the user the best quality letterform possible because it's better to use a font that was designed, pixel-by-pixel (or dot-by-dot), for each given font size and printer (or screen) resolution. Furthermore, you're also saying that if you have text set in a picture, having PostScript won't make a difference since the text is already set pixel-for-pixel in the bitmapped image.

I *THINK* this is what you're saying. If it's not, enlighten me. If I'm right, though, you're almost completely wrong.

First off, PostScript fonts will give you the best quality screen and printer image possible for PostScript fonts, assuming that Adobe Type Manager is installed (and practically all Macs have it installed). There is little need to have multiple pixelforms designed for each font since ATM will create custom pixelforms on-the-fly that match the characters as best as possible. This is what enables the Mac to display any PostScript face on the screen at any size without "jaggies". ATM also allows any Mac connected to a non-PostScript printer to utilize PostScript fonts at the printer's highest resolution; a 360dpi non-PostScript inkjet printer, for example, will print its characters smoothly at 360dpi regardless of font size.

NOW...So far as the second issue is concerned, you're almost right - but the issue you bring up is true for ANY computer, not just the Mac, so it wouldn't be fair to penalize the Mac without penalizing other computers. The "almost" part comes from this: It is possible to set text on a picture at high resolution (i.e., 300dpi or higher) and have it print out smoothly. Furthermore, some packages (such as Adobe SuperPaint) allow the user to add editable text on top of bitmapped images - even low-res ones - so that when it prints, the text will print out perfectly smooth even if the image beneath it is low resolution and jagged.

: The thing is, that the "same" printers are actually two different printers,
: so you must buy a new printer, if you change the platforms !

No you don't. If you choose, you can buy a simple ~$90 interface and go with it. Big deal.

: : : And BTW isn't the Centronix parallel port capable (in theory at least)
: : : of higher performance than the Mac's Apple-Talk serial port? Looks
: : : like the Mac is also using outdated technology.
: : In THEORY, yes. In PRACTICE, no. Looks like you don't know all the facts
: : again.
: Tell me the difference.

A Centronix-type parallel port can channel raw data through its wires faster than the Mac's serial port, so that part is true. However, because of the way the Mac works with graphics (QuickDraw and/or PostScript), the Mac needs to channel a considerably smaller amount of data through its serial port than a typical Centronix-type parallel connector to achieve the same printed image. Therefore, in THEORY, yes, the Centronix port would be faster. In PRACTICE, it's not, because there's less data that needs to be channeled.

The Mac also enjoys several benefits of the smaller and more flexible serial port. Try using a Centronix connector for a network, for example. The Mac's serial ports are physically smaller, making for more efficient packaging.

: In hardware? Why in the world would anyone want or need to do that, when
: there are slots aviailable? The need to solder stuff onto the motherboard
: is a relic from the days when closed systems were the norm.

The hardware access is necessary if anyone wants to implement prgrams or
operating systems, that do not use MacOS, such as Linux for Mac.
The point about the "need" to solder on the motherboard is not quite
clear, because a) some Macs also do not have "open aechitecture" (Mac
Plus etc...) and b) the Atari provides for solts as PDS (mega ST, falcon)
and VME boards (TT, Mega STe). It mybe only one port in the base machine
(as the casings are compact), but, as far as you are familiar with VME
boards, you can easily expand the system to several more boards; so,
where is the problem?

: Re: your point about there not being another OS for the Mac. The MacOS
: is what defines the Mac -- it's why people buy Macintoshes. If people want

Try to tell that to those Mac users, who want to use Linux.
: something else, they'll buy another machine. In any case, this entire point
: will be moot when CHRP comes out.

Exactly. And that will be the time, when MacOS has to measure up to
Workplace Os and the likes.

: [stuff about other OS's for Mac deleted]

I seriously doubt that you can replace Quickdraw reliably and wo. hacking.

: >Now, mybe if we add up all system extension and utilities, Mac OS will
: >probably come ut to have more features (especially in the network area);

: >however, when it comes to speed and usability, you'll never get to NVDI
: >and Magic.

: Tell me more about Magic. I'm not familiar with it.

Magic is TOS compatible, preemptive Multitasking operating system for
Atari computers and Macintosh computers with 68030 and 040 pocessors. A
PPC version is under development. Magic replaces the whole operating
system (except for the Mac, where it runs as Mac application); it can be
booted either from ROm or RAM. It has the possiblity, among others, to
install file systems easily (by copying to the file systems driver folder
:-)); right now there is a filesystem for DOS filesystems (vastly
improved) and MAC filesystems available, that is, you can work on MAC
mediums such as HDs etc in the same way as with the MAC (which means,
that all the discusion points about how much better the Mac can handle
files etc. is futile). It also provieds for Shared Memory, Drag and Drop;
Iconifying of Windows etc. A U:\ drive, similar to Unix has been
developed ; a subfolder holds all curently running processes and tasks.
To terminate tasks, you can, for example, using this concept drag the
icons reprenting the tasks to to the paperbasket as if they were files.
The preemptive multitasking concepallows also for parallel HD and disk
and programm acess (so, for example, disk formatting won't slow the
computer down.
And there are many more points.......

Regards,

Alfred

Dave,
Here is how SpeedoGDOS works. I put all of my fonts in a folder.
Then, if I want to install them, I run a program called outline. This
lists all of the fonts in my folder. I can then click on fonts
to uninstall them (by clicking on the uninstall font button) or install
icons by clicking on them and then the install button. This seems
pretty simple to me. So please stop going on and on about editing
assign.sys files, okay?

If you're going to talk about the Mac Plus, can I talk about the 520ST?
Fact is, neither company has made non-expandable machines for a long time.

>b) the Atari provides for solts as PDS (mega ST, falcon)

That's my point - if there are slots (either on the Mac or the Atari; it
doesn't matter) then there is no need to attach upgrades and expansions
directly to the motherboard, which is what someone claimed was a disadvantage
of the Mac earlier in this thread.

>: First of all, control panels and extensions on the Mac do exactly the same

You're telling me that NVDI somehow infiltrates your Atari and writes itself
over the ROMs in your machine? Sorry, it doesn't. All NVDI does is patch
the TRAPS used for GEM calls and intercepts certain operations, runnning
its code instead of the Atari-supplied code. It's the same whether it's
on a Mac or an Atari.

>: Anyone could replace Quickdraw if they wanted, but there is no need to, for

As has been pointed out earlier in this thread by someone else, it has been done already, but there was no market for it.

[stuff about Magic deleted]
>and programm acess (so, for example, disk formatting won't slow the

Well, that's not just an issue of pre-emptive multitasking. Disk formatting slowing down the computer is also a hardware issue.

I have to admit, Magic does sound interesting. Does it use a GEM-like interface, or does it have its own?

Apple has made several non-PostScript laser printers itself, in the past.
There is no reason why a Mac laser printer would need PostScript -- all
that would happen is that the manufacturer would have to provide its own
printer driver, instead of relying on the LaserWriter driver.

[Guy before David]

I seriously doubt that you can replace Quickdraw reliably and wo. hacking.

[David]

As has been pointed out earlier in this thread by someone else, it has been done already, but there was no market for it.

[Brian (me)]

That's not exactly true. There was a market for the replacement but after a while Apple just bought the code and that was that. Now it would be very tough to replace QuickDraw. That code is fast and tight so replacing it would result in a negligable speed increase. That's why no one has bothered for over 5 years. <- That's speculation.

: letterform possible because it's better to use a font that was designed,
: pixel-by-pixel (or dot-by-dot), for each given font size and printer (or
: screen) resolution. Furthermore, you're also saying that if you have text
: set in a picture, having PostScript won't make a difference since the
: text is already set pixel-for-pixel in the bitmapped image.

: I *THINK* this is what you're saying. If it's not, enlighten me. If I'm
: right, though, you're almost completely wrong.

Yes. That's exactly what I have meant.

: First off, PostScript fonts will give you the best quality screen and
: printer image possible for PostScript fonts, assuming that Adobe Type
: Manager is installed (and practically all Macs have it installed). There
: is little need to have multiple pixelforms designed for each font since
: ATM will create custom pixelforms on-the-fly that match the characters as
: best as possible. This is what enables the Mac to display any PostScript
: face on the screen at any size without "jaggies". ATM also allows any Mac
: connected to a non-PostScript printer to utilize PostScript fonts at the
: printer's highest resolution; a 360dpi non-PostScript inkjet printer, for
: example, will print its characters smoothly at 360dpi regardless of font
: size.

OK. You are right by saying it is a good feature to use Postscript. I agree
too. But no algorithm can scale perfectly and the kerning-tables are quit
small. Don't get me wrong. I don't say Postscript is bad, I only say it can
be done better but with other disadvantages. I'm using Signum!3 and there
you have for every height and modification (italic, bold, great, small etc.)
a different font. You can use only one font and make the modification from this
one, but the better choice is to use a new font. This have the disadvantage
that you need much more memory for the fonts compared to Postscript. So
Postscript is a little bit worse (but the most people don't see the difference
because the difference is very small), but it use less memory.

: : The thing is, that the "same" printers are actually two different printers,
: : so you must buy a new printer, if you change the platforms !

: No you don't. If you choose, you can buy a simple ~$90 interface and go
: with it. Big deal.

Not exactly right for here. I see such an interface (PowerPrint) for
210DM (~ 150 $).

I'm currently working for a mac software developement company while I go to school. I am well aware of the advantages of direct screen drawing. You smash pixel information directly into the VRAM without going through any operating system code. I can't see how using OS routines could be EVER be faster than this, assuming you know what you are doing ie. making sure the pixel information is word aligned, writing entire words, etc. You can also make assumptions about the state of the computer when you do this ie. the monitor is at a certain depth, all the pixels belong to the same screen, the pixels are clipped into my window (if your using one). CopyBits has to check all of these before it moves a single byte. That results in a fairly large overhead if your moving a lot of small objects (like most games).

Okay, thanks for the tech explanation. I see your point. If I say "reserved" characters instead of "illegal" characters, we seem to be saying the same thing. Let me alter my "theory" then:

Since the mac makes it no more difficult to access what are, on other systems, reserved characters, in effect making it unnecessary to think about the naming of a file beyond making it distinct, the typical mac user (who does not use other platforms) as a result, does not think about how their files are named, and therefore, such a mac user is more likely than a typical PC or Unix user to have poorly named files in a disorganized hierarchy.

The end result of this theory fits the facts I have observed. Invisible file typing seems to make mac users clump all sorts of non-related files together in a folder. THousands of custom icons and nearly limitless combinations of filenames seems to result in little organization of files. I cannot tell you how many macs I've seen where the desktop is used as a collecting bin for any miscellaneous file the user might want to access. The areas where the mac limits and the areas where the mac lets the user free all seem to be designed with the aim of encouraginc irresponsibility and ignorance of the way a computer works.

True, but that doesn't justify their blatant price gouging in the 1980's.
There is such a thing as business ethics you know. There also is such
a thing as an expansive marketing strategy, i.e., a plan in which one
tries to increase one's market share; Apple should have done that since
they would be much better off today if they had a 20% market share
rather than a 10% one.

I can't wait to see all your whining about "Microsoft's anti-competitive
practices" when they put Apple out of business. I mean, what would be
so wrong with MS doing that? They are in the business to make money,
after all, and eliminating a major competitor can increase their profit
margins.

Exactly the same as on an Atari... which is the reason why so much software
would break every time there was a TOS upgrade released.

Programmers went direct to the hardware for speed in violation of "the rules",
only have their programs break on the next version of TOS.

Every time a new TOS came out, we'd have to compile a list of programs that
no longer worked, and hope the companies were still in business so they could
release a new version that ran under the new TOS.

Doesn't sound like all that good a reason to condem Apple...

Not quite. Why do I use quotes to create/manipulate files that
include other illegal characters, such as * and ? then? It's because quotes
tell unix "treat whatever follows, no matter what illegal characters it
contains, as a literal argument." similar to yours, but with a distinctive
difference. If unix liked spaces in filenames, it would have made it
normal to use them without the override.

It is a question of how to easily make _two_ different fascilities available in an understandable manner. If a space was automatically quoted, how would you then seperate the different arguments? As with *, it has two functions: It should either be quoted as a *, or we want an expansion. It is natural to use quotation marks on what is supposed to be quoted. As an example, in a directory with the files "my", "little", "file", "my little file" and "m*", the argv[] variable would be filled with the following values from the following commands:

Command: rm my little file
argv[]={"rm","my","little","file",NULL}

Command: rm "my little file"
argv[]={"rm","my little file",NULL}

Command: rm m*
argv[]={"rm","my","m*","my little file",NULL}

Command: rm "m*"
argv[]={"rm","m*",NULL}

Command: rm *
argv[]={"rm","file","little","m*","my","my little file",NULL}

Notice that it is the _shell_ that does the expanding, and that you therefore don't get the same problem when you're writing a program, or filling out a file name in an input prompt of a program.

The only illegal characters in UNIX is NULL, since it terminates the string, and /, since it's supposed to seperate directory names, whereas MS-DOS has a whole lot of illegal characters, since the expansion of * and such is treated by the OS itself, (try "edit *.*" in MS-DOS and "echo *" in UNIX), and the $ is reserved as a string terminator for CP/M compatibility (!).

The quotation marks in UNIX are not meant as "these are illegal characters, but use them anyways", but rather as "quote these characters instead of translating what they usually mean to me". Guess why it is called a quote...

Look at the command
echo $TERM
prints the contents of the variable TERM. Lets say it is "vt100". So, in fact,
rm $TERM
will remove the file "vt100", while the command
rm '$TERM'
will remove the file "$TERM". Normal quotes don't stop variable expansions, white the ' does. This is to allow a variable to contain multiple words and thereby create > 1 argument when expanded, except when it is in a quote, where it will be expanded as _one_ argument. Example:

```
MYVAR="this is cool"
Command: rm $MYVAR
argv[]={"rm","this","is","cool",NULL}
Command: rm "$MYVAR"
argv[]={"rm","this is cool"}
Command: rm '$MYVAR'
argv[]={"rm","$MYVAR"}
```

Just like C, the \ has a special meaning. That doesn't mean that you can't print a \, or that the \ is illegal in a printf command. Hey. In UNIX you can have empty filenames, too. (char *filename={""};)

> to have poorly named files in a disorganized hierarchy.

Oh yeah right, 8+3 is better because it forces people to think. Writing programs on coding sheets and handing them in to be punched up and run overnight also discouraged sloppy programming. Why don't we go back to having just file numbers, then people would *really* have to get themselves organised.

> The end result of this theory fits the facts I have observed. Invisible file
> typing seems to make mac users clump all sorts of non-related files together
> in a folder. Thousands of custom icons and nearly limitless combinations
> of filenames seems to result in little organization of files.

Heirarchical organisation suits some people (and some tasks) better than others. At the moment all the image files on my Falcon are in one folder called ``pictures'', whether they are GIFs or TIFFs or JPEGs or what; except for Dave Hardy's stuff, he has his own folder. If I were doing multimedia work I'd probably keep stills, animations, sounds, and texts all in one folder per project. I call this freedom.

> I cannot
> tell you

(then don't :>)

> how many macs I've seen where the desktop is used as a collecting
> bin for any miscellaneous file the user might want to access.

Sounds just like my normal Atari desktop. :> In fact, I always thought that was what the desktop was for ... of course I also have some pretty mimalist ones, for example to launch Apex Media (ST hi, no icons; saves memory).

> The areas
> where the mac limits and the areas where the mac lets the user free all seem to

Have not the faintest idea what you mean by ``irresponsibility'' here.
As for ``ignorance of the way a computer works'', so much the better.

Ethics? You mean Atari.. Its easy to say what Apple should have done back than. However, Apple is very profitable and sales are up very quarter. Apple just released the 5200 and 580. A new Q630 with an 8/500 config for the same price will be out shortly. Apple has 61% of the education market and about 20 percent of the home. North Amercican sales of Mac software increased to $1.2 billion in 1994.

MICROSOFT RENAMES WINDOWS 95

REDMOND, WASHINGTON -- In an effort to dispel confusion surrounding
Microsoft's upcoming new version of Windows, Microsoft announced today
that it would rename the upgrade -- formerly known as Windows 95 -- to
WinEver.

"There seemed to be a great deal of anxiety about when the produc
would ship. We felt it was in the best interest of our users to free
them from this anxiety," said a Microsoft spokesperson who requested to
remain anonymous.
Industry analysts were quick to praise the decision. "WinEver will
free Windows users from space and time constraints. It also gives
Windows a new timeless quality", said a member of Ziff-Davis Publishing's
Editorial Staff. "This is precisely why OS/2 is failing in the marketplace
-- they have failed to deliver a strategy for their product."

When asked when WinEver would be available, a Microsoft spokesperson
said "Whenever." The same spokesperson added "It really doesn't matter
since WinEver is destined to be the most powerful and popular operating
system ever." Market and industry analysts quickly agreed adding that
"WinEver has already revolutionized the industry."

A spokesperson from IBM disagreed however. "Microsoft is still trying
to sell a product that doesn't exist. IBM has been shipping a 32-bit
operating system for personal computers since 1992 that runs today's DOS,
Windows and OS/2 applications in a stable 32-bit environment with an
advanced user interface. WinEver -- or WhatEver it's called now -- still
relies on DOS device drivers and is not a true 32-bit OS unlike OS/2." He
added that "users who think that WinEver will have no compatibility problems
will be in for a surprise."

Most users seem to remain unconvinced however. "WinEver will run every-
thing and it won't have any bugs or compatibility problems because it's from
```

Microsoft. Why should I buy OS/2 which is less than perfect when WinEver is right around the corner?"

In a related story, IBM has reportedly been working on incorporating WinEver compatibility into a future version of OS/2. Microsoft was quick to express fear, uncertainty and doubt in regards to IBM's chances of success. "IBM is chasing a moving target and without the source code". Industry analysts and the media agreed adding that this is yet another example of "OS/2's failing strategy."

997. ST:TNG "Incident in the Atarian Quadrant"

Newsgroup: comp.sys.atari.advocacy
Date: 1995-04-07 00:00:00 UTC
From: khaley@nova.gmi.edu
Message-ID: <khaley.797262030@gmi.edu>
Source record: 13048

Okay, I had a little time on my hands. Hey, what can you expect?
This current situation inspired me! :-)

STAR TREK: THE NEXT GENERATION
(Transcripts that just didn't make the final cut)

"Incident in the Atarian Quadrant"

RIKER: <Entering bridge> "You called, Sir?"

PICARD: "There is a strange disturbance in the Atarian Quadrant.
Star Fleet has ordered us to investigate."

RIKER: "What type of disturbance?"

PICARD: "Not exactly sure, Number One. Star Fleet lost all contact
with the quadrant 3 days ago. Communications are totally
unintelligible."

DATA: "Now entering the Atarian Quadrant, sir."

PICARD: "All stop. Perform a sensor scan and see if you can determine
what exactly is going on here."

<Lights flash, high pitched beeps and blips echo through the bridge>

RIKER: "Argh! What is that infernal noise?!"

DATA: "Not exactly certain, conducting analysis and filter with the
sensor array..."

<"...Jaguar is DEAD! Atari SUX! Only Lamerz own Jaguars, dudez!
Face it! Jaguar sucks.">

PICARD: "Mr. Data, what is this? Where is this coming from?"

DATA: "My language banks indicate that this is some sort of primitive
Earth dialect, best known as 'gibberish'. Especially common
among individuals of low intelligence and infantile 6-year-olds."

PICARD: "Can you translate?"

DATA: "Negative. We will need an infantile 6-year-old to translate."

RIKER: "A luxury we don't have... If only Wesley were here."

PICARD: "Can you determine the source of these transmissions?"

DATA: "The transmissions are coming from so many directions, it is impossible to determine the exact source."

RIKER: "My God! The entire Quandrant has been paralyzed with this unintelligible line noise!"

<"GEORDI to PICARD" echoes in the bridge>

PICARD: "Go ahead, LaForge."

GEORDI: "I've been performing some preliminary spectral analysis on the line noise. It appears as though the signals are coming from subspace fractures. They're all over the place, Captain!"

PICARD: "As usual, when in doubt, perform a spectral analysis."

<Loud rumbling sound. Enterprise shakes. Crew makes a lame attempt at being thrown around.>

RIKER: "Report!"

WORF: "Outer hull breach near deck 16. Unidentified security breach on same deck. Permission to investigate, Captain."

PICARD: "Granted. We still haven't made any progress with this gibberish. And what do these words 'Atari' and 'Jaguar' represent?"

DATA: "I can scan our logs. We may be able to find some records that will give us further information."

GEORDI: "Captain, there's a Warp Core breach in progress!!!"

PICARD: "What!?"

GEORDI: "Just kidding, Captain."

<WORF reappears on bridge, jumping around like a chimpanzee>

WORF: "Jagflop is DEAD!!! GET OVER IT!!! Lame Ataridroids!!! Jaguar is a basin to pee in!"

<Several officers converge on WORF.>

RIKER: "Get him down to Sickbay! And call Dr. Crusher."

PICARD: "Data, continue with your scan. Get with Mr. LaForge and see what he has discovered. We'll all meet in the Briefing room in 30 minutes."

<30 Minutes Later>

GEORDI: "I think I know what is going on here. The several subspace fractures are actually 'pockets' in time, and they are the source of this incoherent gibberish. The Enterprise hit one of the subspace fractures, where Worf went to investigate."

CRUSHER: "Apparently, whatever exists in these subspace fractures is contagious. Worf was exposed when he went to investigate.

His mental capacities were reduced to nothing. In short,
he became a dolt; an idiot; an utter ignoramus."

WORF: "I am not pleased with your wording on that diagnosis, Doctor."

RIKER: "But what does this have to do with the 'Atari'? And why has
only this quadrant been plagued with the anomaly?"

DATA: "According to our logs, 'Atari Jaguar' was an entertainment
console on Earth in the 1990's. It was plagued with several
lesser beings who held extreme hate for the system."

GEORDI: "The subspace fractures are suspended in the 1990's. Hence,
the source of this incoherent gibberish."

PICARD: "Any solutions?"

GEORDI: "I was thinking, if we replaced the Dilithium Crystals with
New Folgers Crystals, and ran that through the transdu..."

TROI: "No, knocking sense into these things isn't going to work.
They're too dense. A human presence exists in these fractures.
I know its impossible to fathom, but I think this spew is coming
from humans, trapped in the fractures!"

RIKER: "What a horrible fate!"

TROI: "We could free them by breaking their delusions. They firmly
believe that 'Jaguar' is only for low lifes and is
doomed to falure. However, if we show them the truth, that
people actually can have fun with their 'Atari', we may break
their delusions."

DATA: "I have seen such evidence in the logs; they go by the names of
'Tempest 2000', 'Alien v. Predator', and 'Iron Soldier'.

GEORDI: "We could patch them through our subspace beacon and transmit
them through the entire quadrant."

PICARD: "Excellent. Make it so."

<Later>

DATA: "Captain, it seems to have worked. The subspace fractures
are receeding and the delusioned humans have all but disappeared.
However, there is one remaining."

PICARD: "Can you get a fix on it?"

DATA: "Yes. In fact, I've locked onto a single life-sign in the source.
We could use our transporters to bring it to the Enterprise."

RIKER: "Bridge to Transporter Room. We have a target to beam up."

PICARD: "It's times like this when you wish O'Brien were still here."

<Odd looking human appears on Bridge.>

PICARD: "Who are you, and why are you disturbing the peaceful folk in this quadrant?"

PETER: "Argh! How did I get here?! Why are you defending the Jagflop! It is dead! GET OVER IT!!! Pippin will rule! Apple's revenues were up 16% last quarter! Do you dare me to blast you with a barrage of Apple press releases!?"

PICARD: "Your pathetic lack of intelligence has made you lose contact with reality."

DATA: "That is more than correct. According to our logs, the Jaguar was a big success. The Pippin failed. System 7.8 was the last Mac OS that was marketed. Atari garnered so much in revenue that in 1997 they purchased Apple Computer. A new, improved TOS became the default OS for the Macintosh, and there was great rejoicing. Jaguars were soon abundant in Cedar Falls, Iowa."

PETER: "NO! It can't be true!!! You lie!!!
<Shreiking> Arrgghh!!! Look at me, I'm melting!!!!
MELTING!!! Oh, what a world!!! You've ruined everything!
EVERYTHING!!! You and your little dog, too!
Argh!!! You can't get rid of us forever! As long as there there is scum in the gene pool, we will always be around!"

<PETER melts into a odorous puddle of goo>

DATA: "Sensor sweep indicates communications back to normal. The quadrant is free again. However, there are still transmissions coming from that last subspace fracture."

<"This is Captain Kathryn Janeway of the Federation Starship Voyager. We are lost in space. Repeat. Lost in space. If anyone can hear..">

PICARD: "Hmm, more gibberish. Mr. Laforge, make sure that last fracture is closed before we leave the Quadrant. The people in the Atarian quadrant have been through too much torture.

I'll be in my ready-room. You have the bridge, Number One.

Oh, and get someone to clean up this mess on the floor.
Where is Wesley when you need him..."

###EOF###

Now if only we could get rid of the net.dorks around here as easily...

/Kevin

From what I understood, GDOS is a part of GEM, it just wasn't full implemented
in the Atari ROMS. It is mentioned in the ST GEM programmer's reference, so
I'll assume this knows what it's talking about. Admittedly, the original GDOS
wasn't exactly a breeze to use, but SpeedoGDOS is pretty simple, and it *is*
still GDOS. Anyone want to explain the GDOS situation better?

Justify? The market justified it. Who knows what would have happened if
prices were too low. Apple did not and still does not have the manufacturing
capacity to increase their market share. The firm needs to work on a viable
solution to solve this..A new plant is going up online later this year..

What was unethical? Apple invested heavly in marketing and R&D to justify
their expenses.

Now you are going to say that the health insurance/health care industry is not
unethical, despite gouging.

: Ah.. you mean like charging over $1200 for a 16K Atari 800..?

That was in the late 1970's and at that time Apple II's were even
more expensive. When Apple starts charging twice as much for a IIc+ as
Atari or Commodore charge for a 1040ST or Amiga 500, something is wrong.

The retail price of the IIC+ was $729. The original price if the IIC was $1199-1299 with monitor. The IIC was released a month after the Mac in April 1984. The IIC+ was released years later..

As for Apple's pricing scheme, who is still left in the computer market?

However, Apple has had over capacity problems in the past. Apple got into
trouble for over producing Macs in 1985 and resulted in thier first loss in Q2
and may have contributed in the ouster of Steve Jobs. Apple had not forgotten
that because it almost sunked the company.

You have to take into context that Apple until recently was a single supplier
of the Mac and forcasting is difficult when you have to cover all markets. In
the Wintel world, there are many choices to choose from. PackardBell
concentrates in the home market while GateWay 2000 sells mainly to government
and education institutions.

>
>Looks like Atari doesn't have a monopoly on managerial incompetence...

Apple management does not even come close to incompetence going on at Atari.
Atari is incapable of releasing a measly cdrom player as well as games..

Apple was no different than IBM and Compaq at the time. Apple at the time concentrated in selling to the business market as well as too niche markets such as publishing. Again, Apples manufacturing capacity at the time could only support Apples market. Apple produced about a million Macs until the early 90's when the market shifted. So Apple reorganized once again to become a high margin low volume to a low margin high volume producer. Apple changed their manufacturing process to reflect it.

Apple needs to out source their manufacturing to other producers such as Acer and even IBM. If IBM wants to realy make money by becomming an OEM manufacturer should cancel the Jagflop production and produce Macs..

Maybe Apple's new U.S. manufacturing plant will solve their supply problems. I doubt it once Wintel 96 comes onto the market!

Yes, your politics say otherwise. The market has corrected that problem in the PC world but has not in the health care market..

TBZZZT...Wrong. Those prices were in affect in the 1980's until about '84' before the Tramiel's purchase. My HighSchool at the time standardized on the Atari 8 bits until Apple came along and cultivated it..

sinclair@netins.net writes:

<Snip>

:>If capacity was the problem, what was their to stop them from building more
:>factories? They could have - and should have - spent at least a little money
:>on this. Intentionally keeping your market share down just to save you the
:>trouble of building more factories is *stupid*! Did Intel try to keep their
:>market share down when they couldn't meet all the demand for the 386? No!!
:>They told everyone that the 286 and its clones were brain-dead and that
:>everyone should get a 386 or 386SX system in its famous graffiti ads.]

:However, Apple has had over capacity problems in the past. Apple got into
:trouble for over producing Macs in 1985 and resulted in thier first loss in Q2
:and may have contributed in the ouster of Steve Jobs. Apple had not forgotten
:that because it almost sunked the company.

:You have to take into context that Apple until recently was a single supplier
:of the Mac and forcasting is difficult when you have to cover all markets. In
:the Wintel world, there are many choices to choose from. PackardBell
:concentrates in the home market while GateWay 2000 sells mainly to government
:and education institutions.

Over production neatly killed Apple in 1995.
That's a good point. Apple had a lot of problems in 1984-86 that would
have made expansion unwise. But from about 1987 on, Apple was in good
shape. They certainly could have gambled a little bit after 1987 and
built one or two more Mac producing factories so they could expand
capacity.

As for Apple being the sole supplier, they have no one to blame for that
but themselves. For years they resisted Mac clones. It wasn't until
they came out with the Power Macs that Apple realized that the Mac needed
a viable clone market in order to remain viable; Apple then finally
changed it's tune and gave its blessing to Mac clones. Apple is still,
for all intends and purposes, the sole supplier of Mac systems. Few
Mac clones have been released so far, and most the ones that have seem
to be aimed at the high-end server market. I doubt that a serious Mac
clone market will exist until mid-1996 at the earliest.

<Sinflame about Atari mgmt. deleted>

<Snip>

:Apple was no different than IBM and Compaq at the time. Apple at the time
:concentrated in selling to the business market as well as too niche markets
:such as publishing. Again, Apples manufacturing capacity at the time could

:only support Apples market. Apple produced about a million Macs until the
:early 90's when the market shifted. So Apple reorganized once again to become
:a high margin low volume to a low margin high volume producer. Apple changed
:their manufacturing process to reflect it.

Well, since they are still having supply problems, it is obvious that they
didn't shift fast enough. And while its true that IBM and Compaq concentrated
on the business market, other PC/clone makers like P-Bell took care of the
other markets, like the home one. Since Apple was (and for the most part
still is) the sole supplier of Macs, and *knew* it, they should have either
made sure that they could cover all the Mac markets or legalized Mac clones
sooner.

:Apple needs to out source their manufacturing to other producers such as Acer
:and even IBM. If IBM wants to realy make money by becomming an OEM
:manufacturer should cancel the Jagflop production and produce Macs..

Actually, I've heard rumors on c.s.ppc that IBM probably will produce Macs
for Apple. Haven't heard anything about them dropping Jaguar production
though. And why should they, since the Jag is selling.

:Maybe Apple's new U.S. manufacturing plant will solve their supply problems. I
:doubt it once Wintel 96 comes onto the market!

Exactly, because when Windoze96 comes out, they will probably face an
over supply problem that the new plant will only exascerbate. Maybe
it is a good idea for Apple not to have an expansionist marketing
strategy after all..

Sorry, dunceFlop. The Apple II became successful in the
education market to BEGIN with (before the software base was developed)
because Apple (wisely) peddled those lame-o graphics 1Mhz machines to
schools for **FREE** to promote the start of the line. Please try and
get your facts right.....I know you won't, but try anyway.

> mistakes, but do you learn from them. Apple continues to support the Mac line
> with vast resources why Atari abandons everything that it produces.. Whats
> Atari's excuse..?

Atari's excuse was that it was no longer profitable or feasible to market
a proprietary system against the whordes of MS-DOS clones. Apple may
find this out yet, since the industry continues to evolve and SO MANY
people are buying PCs that it makes one's head spin.

> >
> > : I don't think so. Apple Europe = $2 billion in annual sales..
> >

Apple's sales still equal "diddly" in comparison. Forget Atari...don't
bring that up... Come on, Petey.... You want to pick on the
pseudo-defunct Atari line with your crApple.....why don't you pick on the
PC? Are you not ready to lose? It's much easier to ignore PC sales and
compare your Macintrash to the Atari, isn't it....easier for YOU,
Sinflop....not the rest of the world. Take a look at Pee Cee sales.

How about some Pee Cee figures to put those crApple numbers in proper
perspective, please? Let's look at aggregate figures, slick.

>
> You mean Wintel 95 will do it this time? Ha ha ha. The recent Infoworld called
> it a kludge. Even the Amiga OS can multitask better..

It wouldn't be surprising if Winslows 95 is a "kludge", but if you think
it's the last you'll see for the Wintel computers, you're wrong... Gates
is going to ride this x86 cash cow for a long time....he'd like to put
Apple out of business and he'll probably keep working at that goal until
he does.

Sadly for users of other computers, the PC platform has been sparring
with everything from the Apple II and 8-bit Atari to the newest Power
Macintosh. While nobody can call the shots, there is certainly NO
evidence that the PC platform is going to stop. I'm sure there was a
time when Commodore users felt as surely as you do... Hell, I felt that
way as an Atari user.... Apple has a tough battle ahead, man.

> characters instead of "illegal" characters, we seem to be saying the same
Nop, nop, nop! Illegal means: you have to trick the computer in such
a way that other programs or future OS releases will get bugs from
your tricks. Using a space in a file name isn't dangerous at all
-- provided other users know enough about Unix, unlike you.

Here follows a stupid argumentation which I can resume by:
1) Mac users can type anything as a name, therefore they DO anything
and that's a mess
2) Mac desktops seem to be so chaotic

1) Okay, assume that we're constrained as in Dogs/Weirdos.
Little example: I'm developping a small "multimedia" documentation
in which I use custom buttons... LOTSA buttons, stored as PICTure
files. Soudns like: "left arrow yellow disabled 1" or "validate button
enabled p10"
It would be MUCH better organized if I would name them:
L_AR_YD1.PIC or VLBUTENP10.PIC... (there are 50 others)
^^^^^whoups, more than 8 chars!

You're an ASSSSSSSSS HOLE!

2) My desktop (physical desktop!) is a REAL MESS. That's my point of
view, I like it. Remember the early mac ads: the computer doesn't
decide for you. You (hm, I) choose. I'm older than 18.

+---------+
| WRONG ! |
+---------+
Anyone who has access to ftp: ftp://www.info.apple.com
I can't remember the directory!
You don't even need a printer (though it's useful):
the documents are electronically readable using AppleDocViewer
which provides anything you can expect from a digital book
(search, of course, but also a hierarchical table of content, an
intelligent index...) -- and it's free, too --.

> >>And when it comes to the operating system side, there is virtually
> >>nothing the MacOS can do that Ataris OS won't do. As is described before,

I hope you're kidding! I have a strong experience of the GEM
(on a 1040 st -- I don't think the basis of it have much evolved
in 4 years), and I'm now learning MacOS (in fact, I had already had
experiences of it a few years ago). No possible comparison! Just
consider the way overlapping windows are treated for refresh...
Gem sends you hundred of rects you have to redraw in, whereas the
Mac uses "regions" which can be of any shapes (inside, it uses a mask
screen I think).

Consider some things I think to be what make the Mac superior to Weirdos
(v95 included):
- Drag&Drop manager. A recent addition (1 yr old): you can drop datas
from an app to another; for example text (as you do in Word in a single
document) without pressing cmd-c cmd-v, or any other object.
Very user-friendly when used with file-type objects: for example in
Premiere 4.0, you can drag a movier from the finder to your project window,
without opening this painful dialog box.
- Comm toolbox. The system provides a general interface to any kind of
asynchronous device. In general, the 2 standard serial i/o ports;
but that can also be a Telnet driver: any application using the comm
tbox can use the telnet protocol! Also very useful if you have additio-
nal serial ports on a Nubus card. The comm tbox also provides a std
interface for data transfer protocols (xmodem, kermit...) and

terminal emulation; it's less useful, but in France
it's really nice bicoz it allows us to use our national videotex
standard (teletel/minitel) in any comm app.
- lots of other things... but en r'esum'e:
As soon as a new technology (hardware) was introduced,
Apple provided an as genreral as possible api. Ex: Quicktime
Therefore, the MacOS doesn't requires tons of tricks to maintain
backward comptibility, as does Weirdos (this -- how can we call that?
as says Maxis' Ceo: "W**dows is not an OS, it's a pain in the ass"--
thing uses most of its resources to keep compatibility)
Another example of Apple's programmers talent: QT2.0 Musical Instrument
includes a Midi emulator -- that is, you can play midi files
on any macintosh. It uses a part of the available CPU time to compensate
the hardware lack. But if you have a midi expander connected...
(and it's well programmed: for example, the game Marathon (a doom-
like) performs very well with a nice music (very goodd sound!))

I think you completely miss the point.
Quickdraw IS fast for what it is designed for. It's not made for
game programming. But I've been told that if you have to draw something
offscreen (using a gworld or your own routines), you might find it
difficult (not impossible) to perform faster than quickdraw's bitcopy
on large image portions, because it has been designed with 040
cache specs in mind. Gem programmers, trust me (I'm a former 1040 st
owner and demo/game maker), MacOS is REALLY optimized.
Also note that Apple's Quicktime writes directly to the screen when
possible... in Windows!!! (it does on MacOs, too, I think)
By the way Apple is suing Microsoft because they (apple says) stole
the part of their code that writes directly to the screen.

Have you seen the game "Marathon"?????
Textured 3d engine - looks like doom with less fps (I think 30% less
on similar machines, my LC630 compared to a DX2-66 for example) but
with 16bits colors (and even million colors on appropriate systems)
-- it means a 600kBytes screen adressing (640x480 though the graphics
are calculated for 320*240 [but can be full 640x480 on faster mach.
like Powermacs]), compared to MCGA's 64kBytes!-- is there a comparison?
and a variable azimuth (you can look up and down). And midi music
played w/o additional hardware (and a very NICE sound).
I also have games like F/18: a very impressive flight sim, not
many details, but it's about 40 fps on my computer, i think!!!
And there's a really amzing feature: if you have three video adapters
(3 monitors) at the same time, you can play in panorama mode!!!!!!
Wait version2, native PPC, with much details....

This joke was fun! Win Never is a suitable name for the product, but I don't think that even Microsoft would name it that way. A more realistic name, regarding the delays, would be WinWhenever :-).

Regards, Christer.

Nicolas,
First of all, I don't really like Marathon. I am "Doomed" out. I
am sick of all the clones. Besides, one game does not make the Mac
great for games. I know there are others (Descent being an example)
but IMHO the 8-bit's tons of great games beats it out.
Also, Nicholas, if you truly believe that the ST market hasn't changed
in 4 years then look again. NVDI does allow one to drag fonts to a
folder to install them. SpeedoGDOS is also very easy to use. You
should also see TOS 2.05 or higher. I use 4.04 and believe that
it is much better than System 7.5.

So the Mac here costs more than twice as in US. An Atari clone costs the same.

>because they no longer price gouge or is it because they no longer have an
>R&D department?

Hmmm... sounds like we could do a "Search and Replace" here... just substitute "Atari" for "Apple"...

Did you ever talk to Bob Brodie and hear his story about how Atari decided to charge over $1200 for their Syquest removable media 44 Meg drive when other suppliers were selling the *exact same thing* for about $800...?

Garry Tramiel told Bob the users would pay the price because it said "Atari" on the front...

Sounds a lot like "Screwing the installed base by charging artificially high orices for its products" to me..

But you all just stand there in your Atari glass houses and keep on throwing stones at Apple... don't mind me...

> When Apple starts charging twice as much for a IIc+ as Atari or Commodore
> charge for a 1040ST or Amiga 500, something is wrong.

The point is that the companies (whoever they are.. Apple is no different
from Atari) charge whatever they think the "market" will bear...

Why didn't Atari charge less than $1200 for a silly little 16K 6502 system..?

Because that was what the market would bear.. I know someone who actually
paid that much for an Atari 800 computer. He grimaces stoically whenever
I mention it, but then again, he enjoyed his 800 for several years before
I bought mine for $400.

No one ever put a gun to anyone's head and told them they HAD to pay whatever..

If people bought Apple computers over Atari or Commodore or whatever brand
computers, it was because the company had provided a better value to its
customers.. by promoting its products to a wider audience, thus
making third-party hardware and software more available.

I paid MORE for my Atari 810 floppy disk drive than I paid for my first
Atari ST computer SYSTEM... should I feel ripped off that Atari was so
unethical as to charge over $500 for a single sided, super low density
floppy disk drive..?

If not, then what makes Apple "unethical"...?

There ARE no "Atari clones" in the US...

Anyone wanting an "Atari Clone" in the US needs to first KNOW that such a thing is available (just go to your neighborhood local Atari store and ask them.. NOT), then they need to know WHERE in Europe to write to find out about "Atari Clones"... then they need to pay many times more for an "Atari Clone" than they'd need to pay for another platform's equivalent perforance.

Give it up...

Atari computers are nice... but they're like driving a VW bug.

BobR,
You want an Atari clone in the US? Why not write to Lexicor for info on the Medusa? 36 Queensbury ST, Suite 6, Boston, MA 02215. Or e-mail them at info@lexicor.com. Also, I believe that Toad is interested in stocking the Eagle although I am not too sure on this. BTW, I have seen the Medusa in person at the CT Atarifest, a show accessible by many people and advertised in Atari mags as well as probably being talked about on the on-line services and the usenet. And what is wrong with VW bugs? I hear that VW is going to be making them again in a couple of years.

Is the computer marketplace somehow different from the rest of the world..?

Is "something wrong" when Porsche charges 10 times as much for an automobile
as Dodge charges for a Neon..?

Is anyone holding a gun to peoples' heads telling them they HAVE to buy
either a Porsche or an Apple IIc+...?

Why can't Apple charge a million dollars for their products if they think
they can get it..?

Now here's the REAL question... If the Apple was so unethically overpriced,
why didn't people buy the Atari computers in droves..?

With all the quoting and re-quoting, it gets a little hard to follow just
what exactly is being said, but in this case, I agree.

Atari SHOULD have expanded production, and it WAS stupid of them not to.

Do you mean 1984?

It's difficult to forcast when there is a broad product line.

Actually, Apple shut down their Freemont(original Mac plant) Calif. plant due
to high costs associated with.

Hey man.....when it takes a 66Mhz 486 to emulate an Atari VCS (Activision 2600 emulator/games), then I would think that Winslow is fitting.

PS - I'm using Winslows on my notebook PC right now....so I know what I'm talking about. It gets the job done, but I'll still call it "Winslow" and maintain that the name fits.

This time, I must agree: Peter you are right ! For the first (and last ?) time.
It's such a pity that you weren't talking about Atari or Apple. Nice try, though.

I saw an Alpha AXP 150 MHz in action with Win NT on it. It absolutely crawled. You could even see every screen redraw happening; it took 1 minute to get from `press CTRL-ALT-DEL to login' to the point where I could actually enter `guest', and I could only stand about one minute of `Windows intro', as it was too slow to watch. I'm not exxagerating, it was really shocking. And I have the impression that the AXP is not to blame here...

Regards,

Well.. now that my mailer seems to be working, and I know I'm getting out onto the net again, I thought I'd repost this...

For everyone who had so much fun beating up on "Petey" because they were all so SURE they were right, and he was wrong..

Let's all take out our books (Computer Shopper, April 1995) and all turn to page 342.

Now let's all read together..!

Tri-State Computer, New York, NY... 1-800-433-5199

Everyone got the page..? OK, now lets look down near the middle of the page where it says "Laser Printers"... Everyone with me..?

OK, let's read the box that says "Panasonic KX-P4400"... right in the middle, on the right side does everyone notice the black oval that says $299 in it..?

Sounds to me like that's a laser printer for less than $300...

Just like "Petey" said...

(Shall we wait for a round of apologies..? No.. I didn't think so...)

Okay, keep quiet, Bob. If It's easy to find reasons to buy a 10 time charged
Porsche rather than a Dodge, it's more difficult to find reasons to buy an Apple
twice as expensive as an Atari or a Commodore: speed ? prestige ? reliability ?
style ? madness ? Quite doubtful.

1066. SINFLOP FLOPS AGAIN!!!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-04-13 00:00:00 UTC
From: trauth@paul.rutgers.edu
Message-ID: <3mjqmf$mdf@paul.rutgers.edu>
Source record: 13017

To everyone who is sick of the Sinflopian scourge:

Great news!! Peter Sinflop has lost yet another Internet account. Infonet, which had steadfastly refused to revoke Sinclair's account when people complained about his perennial childish, inappropriate postings in r.g.v.atari, revoked it this week when someone on r.g.v.atari was able to prove to them that Sinclair had mail-bombed him (I guess mail-bombing is a more serious offense than flamage and inappropriate postings).

This person had sent Monsieur LeFlop an e-mail message in which he requested LeFlop to take his flame wars with Jeff Minter and other Jag advocates to e-mail. LeFlop sent him a nasty reply telling him essentially to shut up - *400* times! Unfortunately for LeFlop, this person happened to be a sys. admin., so he knew how to get a log of LeFlop's actions. He got that and sent it to LeFlop's Infonet postmaster. On seeing the proof of LeFlop's mail-bombing, the postmaster decided to disconnect LeFlop's account.

In short, sinclair@netins.net no longer exists. If you doubt that, try e-mailing that address and see if your message gets delivered. It wont.

I know that he still has his college account and that it is only a matter of time before he gets another commercial one, it is great seeing him kicked off site after site. It must be expensive to have to constantly get new Internet accounts - and I doubt that Sinflop is a millionaire.

Just thought I'd tell you that good news..

* Tom

PS: I wonder what his excuse will be this time??

Well, times have changed. It seems he's no more an Atari supporter. And I understand this. It's easy to still love the Atari machines and get frustrated with Atari behaviour (or non-behaviour) towards them. Is it the case ?

Uh....WRONG again, "Bear" - my first Atari was an 8K 400 bought in 1980. The computer only existed for about a year before I got my 400 (IF that long). YOU show the cluelessness, and also win "dumba*s of the week" title for saying such a STUPID thing. Congrats is in order.

Volkswagen is considering making a new model which will *resemble* the general styling of the original VW Beetle, but which will be based on a completely different internal design (front water cooled engine, front wheel drive).

And it will undoubtedly be far more available to the general public than either the Lexicor Medusa or the Eagle.

You can actually still get the original VW Beetles (or could a few years ago anyway), IF you know where to look... a bit like finding an Atari clone...

Thus, a general statement that the VW Beetle is available in the U.S would not be very useful for most of the population.

: Why didn't Atari charge less than $1200 for a silly little 16K 6502 system..?

In 1979, Computer components and manufacturing were extremely
expensive. The Apple II was less powerful and more expensive than Atari's
machine. BTW ... those 400/800 prices fell very fast.

: Because that was what the market would bear.. I know someone who actually
: paid that much for an Atari 800 computer. He grimaces stoically whenever
: I mention it, but then again, he enjoyed his 800 for several years before
: I bought mine for $400.

Now you can pick up a used 1040ST for $150 ... what's your point?
That's the way technology works.

: customers.. by promoting its products to a wider audience, thus
: making third-party hardware and software more available.

In the case of the IIC+, I disagree. It was price gouging, plain
and simple. Apple dropped the machine quickly after it was released.

: Atari ST computer SYSTEM... should I feel ripped off that Atari was so
: unethical as to charge over $500 for a single sided, super low density
: floppy disk drive..?

What are you getting at?

: If not, then what makes Apple "unethical"...?

The fact that they charge twice as much for a machine that's half
as powerful as it's competitor's machines. Until recently, Apple was
infamous for this.

I have the following Atari Computer for Sale:

Hardware:

Atari Mega STE 4
4 MB RAM
50 MB internal hard drive
Magnavox ICM135 14" Stereo Color Monitor
External DS(720K) Floppy Drive
Supra 2400 Baud external Modem
Beetle Mouse
Atari standard Mouse
Wico Joystick
3 2600 Joysticks

Software:

Pagestream
WordWriter
Word Flair II with FSM GDOS
Diamond Back II
various other utilities (Warp 9, look it, etc...)
plus MANY GAMES (Dungeon Master, Empire, Uninvited, etc...)

****
Everything is in MINT condition, and I have the original
manuals for the software/hardware, as well as the orginial
boxes for the hardware.

Shipping can be arranged. I would prefer US sales, payment
must be in US funds.

I am asking $800 or best offer for the whole package. Please
send me EMAIL at dogman@svpal.org if interested of if you have
an offer.

James Wood (jamesw@PEAK.ORG) wrote:

: It wouldn't be surprising if Winslows 95 is a "kludge", but if you think
: it's the last you'll see for the Wintel computers, you're wrong... Gates
: is going to ride this x86 cash cow for a long time....he'd like to put
: Apple out of business and he'll probably keep working at that goal until
: he does.

I think that Microsoft is hedging their bets with a Windows NT
version which will have the Windows 95 interface. As hardware gets
powerful enough to catch up with it, Microsoft will have a *stable* OS to
sell. Win95-? will fade away much like MS-DOS by itself did...

My opinion on Apple is that their machines need to be simpler -
like the early Macs - in order to compete with Wintel machines. A
mass-produced small Mac reasonably priced would seize the home market.

Uh.....NO... the point is that the Atari, however expensive, was still
less than the Apple, and the Atari was a superior machine to boot....period.

>
> Why didn't Atari charge less than $1200 for a silly little 16K 6502 system..?

Why didn't Apple charge less than $3000 for an Apple II plus green-screen
system that didn't even do lower case? Hell of a word processor.

>
> No one ever put a gun to anyone's head and told them they HAD to pay whatever..

True, but the Apples of the time were demonstrably inferior and over
twice as much as the Ataris of the time. Period.

> If people bought Apple computers over Atari or Commodore or whatever brand
> computers, it was because the company had provided a better value to its
> customers.. by promoting its products to a wider audience, thus

That's not VALUE. The choices for the Apple (in terms of hardware and
software) were greater, but that doesn't necessarily mean that the Atari
provided any LESS value.

>
> I paid MORE for my Atari 810 floppy disk drive than I paid for my first

Who didn't back then? I distinctly remember when a II plus would set you
back over $3-grand. I'd say you should have felt less "ripped off" with

the 810 than if you bought a II plus.

>
> If not, then what makes Apple "unethical"...?

Apple is not "unethical", just OVERPRICED.

BobR - just curious what it is that you find "nice" about Atari computers. Seems you operate with a bit of a dichotomy there - if they cost "many times more for another platform's equivalent performance" (as you state above), then WHAT, exactly, do you find nice about Ataris????

I just thought perhaps you could clear this up for us.

Uh....excuse me... I hate to continue in such a stupid arguement, but I drive a Porsche (in the summers, anyway) and HOW DARE you compare such a finely-crafted German automobile to a piece of American automaker #3's Detroit JUNK. Call them "automobiles" but don't refer to each of them as simply "an automobile" as if to imply that these are homogenous products....THEY ARE NOT!!!!!!

As a matter of fact, your analogy is unrelistic for the following reason.

	cost	performance
Dodge Neon	less	less
Porsche	more	more
Atari 800	less	more
Apple II	more	less

Sure, you pay more for the Porsche, but you get more. You get more with the Atari, but pay LESS. Either way, the Porsche and the Atari outperform the Apple and the Neon. Please don't compare the Apple to the Porsche.

A kludge it might be, but it's selling circles around the Mac....and
hopefully it will get better. (A ways to go, no doubt, but every Windoze
improvement is another chip against Apple.) Apple users like to pay
attention to the fact that Windoze is indeed a flawed product, while
ignoring the fact that this "kludge" continues to outsell Macs by an
order of magnitude. "GET OVER IT!!" (To use Sinflop terminology)

And you call yourself an Atari advocate! You have just showed your total
cluelessness.

Bob R. founded the Atari SIG on CompuServe and was a major, major supporter
of Atari computers for many years. He's supported Atari computers for years
before you even knew they existed.

The public just doesn't know about the Atari computers. Two years ago, I
started to work for a small newspaper, they had IBM and Mac to work with.
I didn't like those machine, so I brough my own TT and they were all
surprise to discover what Page Stream can do over Page Maker. I am sure
if Atari had the resource of Apple to advertize more the story would be
diffrent, just take a look at the music-midi market.

The mac is definately not second place in all software developement. The mac
is the first platform that Adobe, Aldus and Macromedia ship their products for.
The mac is still number one in graphics art and DTP. As for games there are
a few areas that I think the mac is better. A-10 is the most realistic
computer flight simulator that I've played and Marathon is still the best
first person shoot-him-up game that I've played.

P.S. Those of you Atari guys with mac boards should really download the A-10
demo. The plane slows when you fire your cannon, you have bomb ripple
modes, you have a master arm switch, no radar and, best of all, the plane
handles like crap (like the real one).

Prove it..Give the prices and cite the sources. Yes, the Atari 8 bit line was
technicaly superior hardware wise, but Apple made up in expandibility and
software such as AppleWorks which was responsible for much of the sales.
People could justify in terms of their needs to buy a AppleWorks system.

Your right in terms of numbers. We will catch up in terms of quality titles.

With the upcomming explosion of releases this year and as well as the quality
will make the Mac a premier game platform..GET OVER IT..

Why? IBM could make tons of money if producing the Mac instead of the Jagflop.

I doubt if it will get better. Hardware requirements are higher and users will have to decide the cost/benefits. Apple will hold onto their own and will increase their numbers with new models and the clones. Mac software sales in North America amounted to $1.2 billion in 1994.

That's probably true about those 3 companies. I don't own a single piece
of software from them, and don't know if/when I will. However, my point
is that when I walk into an electronics superstore like "The Incredible
Universe", "Future Shop", "Costco", or even "Circuit City", "Office Max",
"Office Depot" - I see a shelf of MAC software that's about 6 feet high
and maybe 10 feet wide. Then the MS DOS/Windoze section is about the
same 6-feet high, but maybe 50-75 feet long, crowded and full of
selections. Therefore, based on that observation (which has been made
everywhere but the few Mac--only computer stores), I judge that the Mac
is second place. Let me rephrase my point into a question: Do you
dispute the fact that there is more (many times) software available for
the PC than the Mac?
*+=-> note I am not trying to blow the WindoZe horn...I am atteempting to
*+=-> reveal fact.

1097. Don't mean to Atari bash, but...

Newsgroup: comp.sys.atari.advocacy
Date: 1995-04-15 00:00:00 UTC
From: James Wood <jamesw@PEAK.ORG>
Message-ID: <Pine.SUN.3.91.950415164605.12795B-100000@PEAK.ORG>
Source record: 12948

All the Atari bashing that's been going on in this newsgroup (Sinflop, etc.) made me think about what I have to concede makes it very difficult to use the ST platform. The ST hardware isn't to be blamed for this, however.

1) The small and ever-declining software market has always been a drawback to an excellent computer, even back in the days of the 400/800 machines. There's no easy way for me to know about WHEN new software is released. There's practically no way for me to read a review about the software before purchase. It's just a gamble. The nearest Atari software outlets are THOUSANDS of mile from me. It's been several years since I've seen an actual Atari store. Papyrus is rumored to be a nice word processor (which I could have used), but it sells for $180!!! My ST isn't worth that much!! To put the price into perspective, the "Microsoft Office" (Word/Excel/Powepoint/Access) package for PC and/or Mac sells for $149 at the student bookstore.

2. This perhaps makes it most difficult for me to continue to use the ST. There is NO(!!) service available ANYWHERE around here. Whether it's my floppy drives getting old and buggy, or I need a RAM upgrade - I have to send my computer across the nation and pay a hefty fee, plus shipping charges. Even though "modern" computers use easy SIMMs, I wouldn't mind PAYING a local shop to upgrade my RAM, but it's just too expensive for me to ship all the way to Toad, and they are costly. Basically, perhaps the only viable option is for me to buy replacement hardware rather than upgrade/repair what I have. Either way, it's not cheap.

3. I suppose since I haven't been on the net a long time (been isolated), I never heard of newer versions of TOS (until recently), I've never seen a Mega ST, STe, Mega STe, Stacy, TT, or Falcon. This is because the Atari dealers in my home town dried up about 1988. There seems to be a lot of development in the "alternate o/s" market, and I see many references to Magic, Linux, Mint, etc. However, the hardware requirements to run these take me back to problem #2 above. However, more importanly, I have NEVER seen these, and I don't understand how they work. I know to get on the WWW I need to run one of them. It seems that everyone who I see (on the net) who uses these products are already very experienced with these products and "fly by the seat of their pants" with them. What's the probability that I'll get one of these in a box with a nice manual explaining all I need to know about it? Seems like I'd have to be experienced with these products (since their introductions some time ago) to use them now. To rephrase, I've been out of the scene for so long that it's too late to start out as a neophyte with these products. Meanwhile, I can't get on the net with GEM, which I fine to be fine for everything else.

4. I'll have to credit BobR with this one. Seems like with every revsion of TOS, or every next-gen (up one processor class), there are a bunch of incompatibilites to deal with. Hell, it's hard enough to get stuff to run on my ST. You mean lots of my games won't run if I get a Falcon?

5. Cost of upgrading. I've been wanting a Falcon for a long time, but GEE they are expensive. The only way I know to gauge the price is against competing computer platforms. It's about $800 for an entry-level Falcon. I'd need RAM upgrade, processor clock-doubled to 32Mhz, etc. There's also no way to go with mid-level RAM (amount) like 8MB. I don't know much about these machines (been wanting one for a long time, though), but it's my understanding that I have choices of 1, 4, or 14 (??) megabytes. I don't need/can't afford 14 Mb. How about 8MB? That's a nice number - that's what the people I know who use WindoZe run on their Pee Cees. I can't do that, however. OfficeMax has Leading Edge 486 DX2/66 machines with 8MB, 420MB hard drive, 1024 SVGA, 1.44MB floppy, 16-bit stereo, double-speed CD-ROM, WindoZe, and even a 14.4K bps faxmodem - the WHOLE multimedia shebang for $999. Wouldn't it cost me nearly that amount for a 16-Mhz, 1MB RAM, small (or none) hard disk Falcon, by the time it was shipped to me? Then how do I get it serviced? What do I run on it? Lots of my ST stuff won't run?

6. Admittedly, I don't know much about the Falcons, but as I understand it (if the person who told me explained it to me right), if my multisync monitor won't scan down to 15.75Khz, I won't be able to run the ST resolutions on the Falcon? Pick up a PC rag-magazine and look at all the monitors advertised - none of them go that low. What does this mean?

My 520ST still only has a half-meg. I remember posting asking about how to get it upgraded cheaply, and I didn't see a reply. (Note: BobR said he replied - I never saw the reply. Since then, I've learned that something about my net site has been changed to IMPROVE conditions and reduce the occurance of missed messags. Honestly, I never saw this. I've noticed REPLY messages in threads that I've never seen start!). Anyway, that and First Word (the original) have worked for a long time, but it looks too expensive to upgrade.... How much would it cost me to move to a 32-Mhz 14MB Falcon with a large hard drive and Papyrus, compared to that $999 Pee Cee?

I don't mean to knock the ST.... I see demos that make my VGA friends sit up and take notice of my "little" 8Mhz machine, like "Burning Illusion" demo. That one is unbelieveable. However, that quality of software is either very rare, or very expensive, or both.....
How do my fellow Atari users address these difficulties? Maybe y'all have some suggestions.

James

Well, even with "unethically overpriced" products, Apple is still in the computer business, Atari is not.

That has to say something about the perceived value of the product Apple is offering. Enough people seem to consider whatever it is they get from Apple products to be worth spending the money on.

Again, nobody forced anyone to buy Apple products instead of Atari or Commodore. Those who did, and still do, must be finding them worth the difference, or nobody would buy them...

> Peter was wrong. He tried to tell us that Mac inkjet printers (selling
> for $300) were in fact laser printers

Umm.. No..

Peter said you could buy a laser printer for less than $300...

Atari Cheerleaders here jumped on him and said he was lying, that you could NOT buy a laser printer for less than $300.

In fact, you yourself, Mark, said that you'd checked, and you could NOT buy a laser printer for less than $300.

You were wrong.

Peter was right.

> You really enjoy being an ass, don't you Bob?

Nope... but I do enjoy identifying the asses amongst us.

Like I said.. Peter was right, you were wrong.

Sorry that it's so hard to admit it.

BobR

(I've already been warned in private e-mail that it's not nice to "defend" the c.s.a.st "whipping boy"... gosh.. that's too bad...)

1101. Re: Laser printer for less than $300..?

> Do you have *any* clue who BobR is?

No.. do you..?

How about... BobR is the guy who was sitting around the table one morning when one of the other computer engineers who was flipping through a Computer Shopper said "sheesh.. a Laser Printer for less than $300... I never thought I'd see the day...", and coincidentally happened to notice that people on the comp.sys.atari.advocacy newsgroup were woefully uninformed about current pricing structures in the general computing world.. uninformed in fact to the point where they were using that misinformation to beat up on someone they happened to disagree with.

Now.. the question is.. are you big enough to admit you (whoever you happen to be) were wrong about the pricing of laser printers..?

Or will you try to deflect the issues into some kind of personal attack on someone so you can cloud the fact that YOU were wrong..?

I don't really care if anyone here disagrees with me, or Peter, or anyone else... but if you're ready to jump on me (or Peter, or anyone else), you better be RIGHT...

Everyone who jumped on Peter because he said Laser Printers could be bought for less than $300 were WRONG.

Period.

End of discussion.

Sorry it's that hard to admit you were wrong. Better luck next time.

Before anyone goes nuclear about this, I'd even defend James Wood if he ever was right about anything.

> What are you getting at?

Well, I guess the point is lost on you, Mark...

Atari charged all the market would bear for their products, just like Apple did.

Unless you're lobbying for a completely Socialist society, as far as I've known, anyone is completely free to charge whatever they want for their products.

And just as importantly, people are completely free to buy whatever product they want to.

And the people with the completely free choice still chose to pay Apple's price for their computer systems.

(That is, unless you can document anyone putting a gun to a consumer's head and telling them the HAD to buy an "overpriced" Apple system"...)

Atari was simply incapable of competing. They had the better hardware, but they couldn't figure out how to get it into enough peoples' hands to make their system the system of choice.

I regret that, definately... I never had any interest in an Apple II system after I'd found out how good an Atari 400/800 was... but Atari, Inc. themselves never seemed to understand what they had, and they lost the chance to outshine the Apple systems.

Apple charged Porsche prices, and people bought them...

So what..?

BobR

1103. Re: Laser printer for less than $300..?

It really must be interesting having such faulty memories.. or such conveniently and selectively defective memories as we've seen demonstrated here recently...

Let me just this once refresh everyone's "memories" about this particular message thread...

This thread grew out of the "parallel printer vs serial printer" thread.

Someone, in this case Peter Sinclair (although that particular fact doesn't matter to me at all.. I'm not, as suggested in e-mail defending that individual), said in the course of the "discussion" that you could buy a laser printer for less than $300.

He did NOT say you could buy an "inkjet" printer for less than $300.

The ones with the selectively weak memories here have provided that little bit of fiction.

Mark Rathwell (sorry, Mark.. I'm not picking on you specifically, but yours is the only message I remember in detail) said he'd checked and you could NOT buy a laser printer for less than $300.

(LASER printer... got it..? Not inkjet.. LASER printer)

OTHERS here said Peter must have been talking about an INKJET printer, which is where the confusion arose.

The discussion wandered off aimlessly in that direction, mostly because my mailer seemed to be hosed and my messages about the $299 laser printer I'd seen in Computer Shopper were going off into cyberneverland.

All the smokescreens and selective memories in the world won't change the fact that someone said you could buy a laser printer for less than $300, and regardless of the fact that he was jumped on by all the "Correct Thinkers" here, he was right.

Asking for apologies for Peter Sinclair..?

No.. I was sarcastically suggesting that the "Right Thinkers" here would NEVER apologize even if proven wrong.

Given all the misdirection, redirection and faulty memories, looks like I was right in that.

> understand this. It's easy to still love the Atari machines and get
> frustrated with Atari behaviour (or non-behaviour) towards them. Is it the
> case ? Pascal.

Umm.. not exactly.

(Actually David was close... I started the Atari Roundtable on GEnie after running the Atari SIG on Delphi. I'm a Sysop on the CompuServe Atari Forums now. And while I don't hold an office at the moment, I've also been an officer in two of the local Atari users groups over the past 10 years, often in both groups at the same time.)

I am, and always have been, a supporter of Atari users.

That's a lot different from being a supporter of the company.

I do love the Atari machines, but as you said, it's very easy to become frustrated with the lack of support from the company.

> Just like the comparison of cars and computers.

Here's my point... a product is not very useful to the general populace if it's not easily available or even known about.

The VW Beetle was available in the US for many years since VW stopped importing it, but only if you knew about it, and only if you knew how to get one. For the general populace, it essentially stopped existing.

The same is true for the Eagle and Medusa "Atari clones". For the average computer user, they don't even exist.

>
>Is "something wrong" when Porsche charges 10 times as much for an automobile
>as Dodge charges for a Neon..?

Nope, it would be wrong if VW charged 10 times as much as Chrysler.
You pay more money for the Porsche because of a) the low US Dollar
(Porsches are produced in Stuttgart, Germany) and b) the better hardware.
Neither was true for the IIc+ vs. Amiga/ST.

>Why can't Apple charge a million dollars for their products if they think
>they can get it..?

That would be a) a sign of bad marketing and b) considered unethical by
the customers. That's why European ST and Amiga sales were higher than Mac
sales until the early nineties.

>Now here's the REAL question... If the Apple was so unethically overpriced,
>why didn't people buy the Atari computers in droves..?

They did, see above.

BobR, you have to admid that the laser printer that you cited is useless
for the Mac. How much memory does it have? Of course, the price of the
laser printer is going down every day, but the only concern here can you
use, as it is, with the Mac because the whole purpose of this threat was
printer for a Mac and how Apple overprice their hardware.

Answer: No, of course not, it would be ridiculous to claim that the mac has more than a small fraction of the software available for PCs.

However, the mac has enough software to serve most people adequately. There is a list of software that is missing for the mac and it only has about ten items on it. And these items tend to be in fairly obscure areas. On the other hand, if you are doing DTP or graphics art, you are still best off getting a mac. Shelf size isn't terribly important as long as you can get what you want. I will say that games are a big deficiency on the mac. That which is available is good but there isn't much available :) Finally, LucasArts has started porting their games to the mac. That should fill a fairly large void.

BTW, has you noticed that the IBM aptiva commercials feature the game Lunicus. Lunicas was first released for the mac and the game, while fun, takes about 4 hours to complete at intermediate level.

>Falcon. I'd need RAM upgrade, processor clock-doubled to 32Mhz, etc.

My Falcon-system costs about 30% more than a 486-PC -system
(without 8-channel sound :-)), BUT:
There is no way of doing the same thing(s) I'm doing with my Falcon,
with a PC. If I would have had the machine for some other purpose, it
might be vice-versa.
Optical in/out, DAT-backup, 8-16 channel audio (which plays while
recording - the majority of PC-soundcards (2 ch.) do not!),
8 separate outputs, system in ROM, inbuilt SCSI...
All these things weight against a PC-setup.

But, if you get Falcon for other reasons than music: situation might
be different, unless you want to use a specific software which uses
the DSP, or just have it for fun and hobby.
For me the first reason for getting the Falcon was the software,
second reason is the available hardware and it's cost.

If you strip the Falcon out of all hardware that is what you'd need
anyway even if you got a PC or a Mac (SCSI-drive, VGA-display,
more memory, possible audio expansion, faxmodem, CD-ROM, cables...)
you'll end up having only the main unit and perhaps the SIMM-expansion
card. You'll see that the cost of the Falcon itself is not much in
the whole setup. And all that extra stuff can be easily transferred
to a Mac-system, if you change your mind later.

>6. Admittedly, I don't know much about the Falcons, but as I understand
>it (if the person who told me explained it to me right), if my multisync

>resolutions on the Falcon? Pick up a PC rag-magazine and look at all the
>monitors advertised - none of them go that low. What does this mean?

That goes only for some ST-low GAMES. I have a MAG-multisync monitor
that can not do 15.75Khz, but I can still use ST-low (who wants to use
ST-low in a Falcon anyway???). Most of the Falcon demos need RGB, so
if you're into games and demos, get a TV-set next to the VGA.

>I don't mean to knock the ST.... I see demos that make my VGA friends
>sit up and take notice of my "little" 8Mhz machine, like "Burning
>Illusion" demo. That one is unbelieveable. However, that quality of

>software is either very rare, or very expensive, or both......
>How do my fellow Atari users address these difficulties? Maybe y'all
>have some suggestions.

The software you use daily must pe paid for, no matter if you use Mac, PC
or Atari. If you don't pay for it, the platform and support is doomed
(see what happened to Amiga). Where you're gonna find it: well, the net
is the best source of information, and ftp sites are full of excellent
shareware stuff. 90% of my utility programs (FAx, terminal, packer,
OCR, sort, find etc.) are shareware, and they certainly look and
feel better in a Falcon (= new AES) than in the old ST (I've had
1040 STFM and MEga 4 with SM194).

I have made my PC-friends seek for second-hand Falcons after
showing them Cubase Audio, Apex Media, and even shareware software
like Connect and WinRec. It seems that grass is always greener on the
other side...

Atari Falcon 030 w/
85 Mb Internal IDE HD
4Mb Ram
VGA Adaptor
VGA/RGB Switchbox (home-made)
ScreenBlaster II
All Original Bundled Software (SpeedoGdos, AtariWorks, etc.)
All Original Manuals, Boxes, Mouse, etc.

I currently have a 16 meg RAM upgrade installed (single 16meg SIMM type)
which is also available with the system or separately.

Also available is a LOAD of software, which I'll throw in for good measure.

AND, I'll throw in BEST Electronics' TT-Touch keyboard upgrade and
whatever else I can find. ;)

SO, interested parties can contact me via E-mail with offers. I don't
know what the value of the system is; I do know that the current retail
prices are STILL OUTRAGEOUS. So, make an offer and we'll go from there...

> maintain. Give me a 132 HP Neon anytime..

Only you.....SINFLOP....would say that Porsche sucks. They are expensive, they cost a lot to maintain, but they do not SUCK. They are amongst the finest quality cars in the world. Personally, I'd buy a $19,000 Z-28 Camaro with 275hp if I wanted bang for the buck.... As for the 132hp Neon....don't make me laugh by comparing it to the Porsche. The Porsche I drive could waste one of those half throttle, and is a distinctive (albeit overpriced in my opinion) car. However, while a Porsche may not be everyone's cup of tea, it does not "suck." By saying that Porsche "sucks", one again you have shown how WAY OFF BASE you are, you slippery little moron.

> In what way do you get more for the Porsche? Your talking about a $12000 auto
> versus greater than $50,000 for a Porsche.

You get a VERY high quality auto - with NO sqeaks and rattles, a VERY high performance engine, leather seats, precision abounds from the headliner to the gearshift to the paint. Yes, the Porsche costs more than the Neon you BONEHEAD, but I am not the one who made the original comparison. It was your buddy BobR who made the original comparison between Porsche and Neon, speaking as if the two are a homogenous product. Obviously, neither of you knows what the hell you are talking about and lack the ability to appreciate the finer things in life, regardless of price. Toward this end, while I cannot afford a new Mercedes Benz (and may never own one in my life), I know that they don't and I do appreciate the quality (My uncle in L.A. has one and driving it was a real treat for me).

What is there to "GET OVER?" Is there any less of an "explosion"
(to use your term) happening to the DOS/Windoze computers? I expect the
PC game market will stay ahead.... A Pee Cee is already a "premier"
gaming platform. Case in point: A Pee Cee friend showed me Wing
Commander III and I was *totally* amazed. My Mac friends don't have that
luxury. Even "crippled" with the segmented memory addressing, slow
WindoZe, potential IRQ conflicts, TSR device driver juggling (etc), the
PC plays the BEST GAMES ON THE PLANET. How can anyone argue with that?
A Pee Cee is like an overpriced Nintendo....and just as much fun.

Despite this crazy notion of yours that IBM could make tons of money producing Macintrashes, they DO NOT. Might I remind you that IBM has that option now that Apple clones are made, yet they do not make them, as does Radius and other companies. Yet IBM **does** make the Jaguar. Do we have to remind you that IBM knows a little more about this than you, SINFLOP, and if they could make money building Macintrashes they would, and if they couldn't make money with Jaguars, they wouldn't make them? Face it SINFLOP, you've lost this one. The evidence (reality) is against you yet again. Proof: IBM makes Jaguars and not Apples. Argue with a signpost, why don't you?

Don't you feel like a badass trying to act like an Almanac of Apple facts? Heh heh heh. Sorry, even putting up actual numbers (any of which may be of dubious authenticity coming from you, SINFLOP) doesn't help your arguement. I don't know what the software sales for Pee Cees was in 1994 in North America (or the world, for that matter), but it was MANY TIMES whatever Apple's was. Put that in your pipe and smoke it.

> My point was that Peter was trying to pass off Ink jets as laser printers.

Nope..

If he HAD cited specific Mac models, I never would have taken any notice, since I have virtually NO interest or knowledge of Macintosh products.

He specifically stated that (generic) laser printers could be bought for less than $300, which is what caught my interest, since I had just that day seen one for that price myself.

When he couldn't document a $300 laser printer himself, OTHERS here said "you must be talking about inkjet printers", and that's when the discussion turned to inkjet models.

His statements were twisted into "there's no such thing as a $300 laser printer, so you must have been talking about an inkjet printer, and you're so stupid for not knowing the difference."

My point is that there IS a $300 laser printer. Whether or not he knows the difference between lasers and inkjets is really of little interest to me.

(It was both frustrating and amusing to watch the "discussion" proceed, and not be able to post to the net, with the knowledge that Peter actually WAS right, even though he didn't seem to know it.)

> I am sure if Atari had the resource of Apple to advertize more the story
> would be diffrent, just take a look at the music-midi market.

Oh, I agree completely..!

That's part of the "perceived value" I mentioned that Apple brought to the market with their products.

By having an aggressive marketing program they made the Apple name well known in all circles, which gave the "warm fuzzy feeling" to purchasers of the systems that they were buying into something well-established and likely to last (or at least maintain its value to them).

This had the further effect of enhancing the value of the systems by encouraging third-party developers of software and hardware products to invest their time and resources into creating new applications those buyers of the Apple systems could purchase to further enhance their computers.

Thus, even though the Apple systems cost more than competing computers did, they also provided the perceived value of far greater credibility, a much wider range of expansion, and a better feeling of security for the purchase.

On the other hand, Atari never did much to promote its name or products, which lead to a far lesser credibility in the marketplace. It didn't matter that the computers themselves were FAR more capable if you couldn't find them or find software to run on them, or if you never saw them advertised, or no one else you knew owned one.

Does Apple publish games? And, as a matter of fact, Atari was the first company to bring out a CD-ROM player, but it flopped. Ask them about CDAR 504 sales and release date.
In Germany, the CDAR 504 shipped with a PD CD containing ST Computer PD series disks 1-270(!), in January 1991 (the oldest issue I could find that fast) the disks 376-384 were presented.

At ~8 disks per issue, this leads to the assumption that the CD was produced early 1990. When was the first Apple CD-ROM available?

Source record: 12973

This is essentially what I said in response to the same question about upgrading the memory in a 520ST previously...

The very BEST upgrade for a system like that is to take the money you'd put into buying the upgrade, the cost of installation, and the cost of shipping the system cross-country to somewhere like Toad, and put it toward buying a used 1040STe.

Seriously... any memory upgrade installed into any Atari model previous to the 1040STe will be less reliable and more expensive.

The STe uses industry standard SIMMs which are easily obtainable, easily installed, and relatively inexpensive.

In addition, it includes a MUCH improved version of TOS, improvements in the color pallette and stereo DMA sound, as well as other minor incremental improvements.

I bought an STe with 4 megs of RAM already about a year ago for $125... far less than an equivalent RAM upgrade would have cost.

Used STes come up for sale relatively often in the atari newsgroups, on local BBSs, and in local classified ads...

The old 520 can be kept as a backup system, or used for MIDIMaze, or sold for whatever it brings and applied to the cost of the STe.

> Nope, it would be wrong if VW charged 10 times as much as Chrysler.

"Wrong"... what would be "wrong" about it..?

They might not sell very many cars, but what would be "wrong" about it..?

Illegal..? Sinful..? Immoral..? Not Allowed..?

Not at all... VW could charge anything they wanted for their products (that's called capitalism)... you and I might not buy one, but they could still price them at any level they wanted to.

I don't personally believe that a leather covered radio knob "should" cost $100, but that's what Porsche charges for it... is that "wrong"..?

Atari never released their ST cdrom in the USA. Atari made noises about it and constantly announced release dates that were never kept. The first computer cdroms were out on the PC first.

The first Apple Cdrom came out in the 88/89 time frame.

Alert! Alert! Alert!! Petey is being an arguementative DUMBASS
again. Going out-of-business is a risk with ANY warranty in ANY
industry. Don't try to twist this into an anti-PC (or anti-anything
other than Apple) arguement. Are you saying that PC buyers should put
thier warranty registration cards in the trash? Only you could make
such a foolish and feeble attempt to invalidate the advantage of a 3-year
warranty.

I'll never understand what took Atari so long to get into CD-ROMS. I still have the (I think) September 1985 issue of Antic magazine which featured the then-developing CD-ROM. There was an experimental Grolier's (text only, most likely) Encyclopedia being developed, and I think they had it running on the ST.

I recall them saying that Tramiels were holding out for a little while because they "thought the consumer should get audio CD capabilites at the same time" and he "wanted to bring the technology to under $500." What happened? It wasn't for another FIVE years (maybe more?) that the PC/Mac world got into CD-ROMming. That is an incredible market lead time. Back then, the Atari's graphics were WAY ahead of the PC.... Hell, most PCs (with green screens and 360K floppies) were nowhere near CD-ROMs. When PCs and Macs finally got CD-ROMs, they never looked back. Seems like the CD-ROM software for the Atari is very rare now. Is ANYONE making Atari CD-ROMs, other than shareware collections? That "Sara" program that allows Ataris to access the data on some of the PC CD-ROMs sounds interesting. Anyone know how well it works?

Message-ID: <798165392snz@yeadontt.demon.co.uk>
Source record: 12842

This is an announcement for a new package for the Atari range of
computers called OASIS.

As of Tuesday 18/4/95 I have upload OASIS100.ZIP to the following sites

DEMON ftp.demon.co.uk

Posted to the incoming folder in the Atari section of
their FTP site

HENSA micros.hensa.ac.uk

Posted in the incoming/atari-tos folder in the incoming
area of their FTP site

Chameloen BBS (UK 01454-831095)

Uploaded to the Comms area of the bulletin board

OASIS is a GEM based off-line reader replacing the complete set of
AtariNos off-line utilities, the only items retained are the NOS on-line
software and the DEMON.TOS batch file launcher.

There will is no shareware policy on version 1.xx of OASIS, just E-Mail
me if you use it. Comments, likes/dislikes, wish lists for further features
and Bug reports, if any :-), would all be appreciated

Wintel software approached $5billion. Microsoft accounted for about 50
percent. On the Mac side, Microsoft accounted for 30 percent of the total. So
essence, developers can have more ooportunites away from Microsoft's
juggernaut in the Mac market..

I don't know if Windows applications are bigger than GEM ones, but the memory
requirements of a Falcon are certainly lower than those of a PC, because PC
applications and games tend to be so HUGE (thanks Microsoft, amongst others) that
you need more and more memory and processor speed. Moreover, you need some room
to make Windows fit in.
Are there Falcon apps which really require more than 4 Mo yet ? Maybe with an OS
other than Multitos ?

Sinflop: Wing Commander and Wing Commander III are **TOTALLY**
different! Of course, since you use a Macintosh and WC III is not
available to you, you'd have to be a keen observer of other platforms (of
DOS, in your case) to know it. Obviously, you are not. WC III comes on
about 6 CD-ROMS and has theatrical graphics that are out of this world.
Downside, like many Pee Cee programs, it requires mammoth hardware....
As I understand it, even a high-powered 486 will choke in some
instances...the box says "Pentium preferred for best SVGA performance."
Typical, eh?

James

: Defender?

Well, let's see...While it was a lot of fun for awhile, I stopped playing MULE when (a) all of my human competitors got tired of losing, and (b) I got tired of beating the game at its highest level. Rescue never amused me for any significant amount of time. Defender got boring after the third or fourth hour of play.

I'm constantly amazed how people compare 10+ year old games to new games. "Hey, have you played Doom on the PC?" "Why? I've got Q*Bert on my Atari 400!" *sigh*

price is more like $350 but it's certainly a reality.

While I hate to sound like a Falcon basher, dropping the computer
line was really the only thing Atari could do. With the standardization
of "Intel" machines and thousands of companies competing cut-throat,
Atari could not make enough money off the Falcon to survive for very
long. If Atari had stayed with the Falcon line, they'd be bankrupt right
now.

To all who are trying Oasis.

We are sorry for the troubles that people are experiencing :-(

Unfortunately we have two acts of God and on of BT acting against us,
Phil's TT blew its power supply, A hard disk corruption, My own phoneline has
been useless for a modem for just over two weeks and various last ditch
attempts at getting Oasis out in the last week drained us.

Even when we finally got it out we stupidly left a line of code used in
running the test version so Oasis100 becone Oasis101.

Now its out we find that the ST Medium Res resource has corrupted and
various extremely minor bugs that appeared in beta test, which we put to bed
ages ago are re-appearing.

Enough of this snivelling.

Please give us 2 days and correct these errors and we will upload
Oasis102 which we will make sure is as bug free as we can get it.

Again we apologise to any who have had trouble - if you aren't having
troubles please still upload the Oasis102 version.

Sorry again, Dave

$350 seems a bit on the low side to me. I will have to check PC Mag. and
Byte to see if I can find any laser printers priced in the $300-$400 range.
I doubt that I will find one though.

But in any case, that is moot because the printers that Peter was referring
to as "$300 laser printers for the Mac" were actually INKJET printers. I
know because some of the Mac "laser" printers he referred to, like the HP
Deskjet, were inkjet models. He was dead wrong, and even admitted that
he was eventually -- but only after making a fool of himself by claiming that
it was ok to call an inkjet a laser because "Most users can't tell the

Apple is not going anywhere but up. Apple has announced their most recent
results.

Q2: sales of 2.65 billion up from $2 billion from the same period last year.
That is a 28% gain. Unit sales were up 20% which resulted in another million
plus units sold. 400,000 powerMacs were sold. Q2 is usualy a slow sales
period but not this time. Apple is on target to exceed $11 billion in sales
this year.

Yes i saw the add in Atari World, and also a review but #2344 (ukp)
is just a bit steep. However if C-Lab made one with TOS 5 (or magic),
4mb RAM, 80mb internal IDE for #549 they could shift em no hassle.
However I doubt C-Lab would have the cash or the willingness from
distributors to be able to do this.

Well, it seems were going into the realms of the Sinclair QL, ie
no official machine, lots of clones and a slow death.

I never saw the CDROM released. I remember reading an advance blurb in
ANTIC about it, and the UK Atari mags were promoting it touting it as soon
to be released, but it NEVER came out on general sale in the UK. It was
certainly never heard of after the advance blurb.

It certainly would have been a major boost for the ST at the time as it
would have _shot_ it to the top of most educational establishments lists.
And at the time the PC although popular was just another competing
computer system, rather than the all-powerful monster it is today.

Just another case of Atari business excellence I guess :-)

I really don't think I need to do research, "pal." If you'll notice, I said "about" 6 CDs- the reason for my inaccuracy is that I don't really give a rat's ass how many CDs it is on. The point I was making was that it isn't available for the Mac, like so much other software. I'm not trying to knock the Mac hardware, but I contend that after years of using an Atari and hardly finding software for sale anywhere (even when the Ataris were at their peak), the chances of that happening to me as a Mac owner is greater than if I own a Pee Cee. Yes the hardware requirements are a lot - that's why I said that in my original post....

Looks like the only useful input you've given us (seasoned with a little smart-ass) is that the game is on 4 CDs rather than 6, as I guestimated. You are to be congratulated for such relevant testimony.

Ha! Classic Sinflop Trash... You just don't know the difference because
you don't have a laser handy. I didn't notice until I finally got a laser.
THough my BJ-200 says it has 360 dpi, in reality the spreading of the ink
gives it a much lower apparent resolution. On a laser, there's no
spreading, so it looks much better even though it's "only" 300 dpi.

Dare to compare. Or, for petey, dare to think! It'll do wonders.

Yeah. Of course, their earnings are lower then many hoped for, especially
with the dollar doing so poorly. Canon is thinking now of buying them
out. Just read it today in the Merc! Dare to read!

The question that's always puzzled me is... why did Atari even bother in the first place..?

The Intel dominance of the computer marketplace isn't something that has cropped up in the last year or so.. when Atari released the Falcon030, they already knew Intel machines would bury it in sheer numbers, and they already knew that it was essentially obsolete, with more powerful competitive systems available at similar prices.

The Falcon030 was only available for a very short time, and only sold a very small number of units relative to the entire computer marketplace. I really wonder if Atari ever broke even on the development and manufacturing costs.

Everyone says they decided to put all their resources into developing and marketing the Jaguar video game system... but when the Falcon was released, the Jaguar plans must have been known, or at least in advanced planning stages, so why did Atari even bother with the Falcon at all..?

Sinflop you dumbass....HP leads the standards for laser printers! Don't play it off like they don't! They make computers, they make portables. Sure, they make a lot of inkjets too - but not the best. Don't try to change HP into an "inkjet-only" manufacturer to support your weak arguements. A 600DPI laser will make sharp output on cheap paper - Inkjet requires coated paper. Not a big expense - which is why I use inkjet myself. With coated paper (in the inkjet) the output is very close.

How many Amiga 4000s were sold when those were the rage?

> Apple is on target to exceed $11 billion in sales this year.
>

Uhhhh...This year isn't over. How can they be "on target" when the year is young? They'll be "on target" when/if they exceed the $11 billion. They may have set those goals, but setting goals and being "on target" are two different things.

It's so irritating to watch YOU, SINFLOP, the great mis-informer, try to play "Apple Almanac" and spout figures like that. You then get all cocky and ask other people for figures. Sorry butthead - I don't need to research (nor do I have time for) figures. I just walk into Costco and look at the 1-2 Mac machines for sale compared to 8-10 PCs, then look over at the software table with from 1/3 (best) to 1/8 (typical) of it devoted to Mac and the rest to the Pee Cee, then go shopping all over town and see the same thing - and I have a pretty good idea of where the market stands. I do this while you sit there at the keyboard and try to spout off sales numbers for what Apple is dreaming about this year, while steadfastly attempting to IGNORE what I have just said. ENJOY YOUR DREAMWORLD, Sinflop.

Amiga Alive.... I'm glad I don't have any stock in Escom (who/whatever that is). Ever since the dawn of personal computers, it's been a struggle for standards and it's up the to PC and Mac to duke it out from here on out. I wonder what they possibly think they can do with the Amiga now? If it doesn't run Microsoft it's a dead platform (as besides the Apple OS, Microsoft products are the rage on Mac too). All they can hope to do is cater to a small market of die-hards. As someone else mentioned, it was wisest for Atari to get out of the computer business when they did. I don't expect to see any hot new Amiga hardware flashing across the covers of the magazine stands anytime too soon.

Inkjet printers have improved in technology and price. Apple has just released
a replacement for the StyleWriter II with the StyleWriter 1200 for $269 list.

My inket the StyleWriter II uses printer paper and photo copy paper. I don't
need special coated paper, DUMBASS!

A 600DPI laser will set you back $900 with postscript. For my needs a Inkjet
is fine.

Mac users buy from mailorders such as MacWareHouse, MacConnection and MacZone. 50 percent of Mac software sales derive from mailorder. Why should I spend $69 for Marathon at the local Software etc when I can order it for $39 from any of the above mailorders?

The Mac software figures come from SPA. Apple's sales figures came from last Friday's New York Times

1170. FS: Digidesign Sound Tools editor for DAT

Newsgroup: comp.sys.atari.advocacy
Date: 1995-04-24 00:00:00 UTC
From: drichard@execpc.com
Message-ID: <3nf5k0$64t@homer.alpha.net>
Source record: 12871
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,fr.comp.sys.atari,comp.sys.atari.advocacy

For Sale: Digidesign Sound Tools system for Atari Mega ST. Note, this system REQUIRES a Mega ST because the DSP board plugs directly onto the Mega ST's bus. I paid over $2000 for this system, and am asking $450 or best offer. It's in very good condition and comes with original manuals, etc. If you're unfamiliar with the system, here's what it does:

The Digidesign Sound Tools system is a hard disk digital audio recording, playback, and editing system. It can be used for mastering CD's, tapes, etc. or for editing digital audio. The system I'm selling consists of the following 3 components:

1) DAT I/O digital interface for doing direct digital audio I/O (entirely in digital domain) from DAT, Mini Disc, DCC, or a CD player that has digital output. It has both AES/EBU and S/P DIF ins/outs. This is a separate box with cable that plugs into the DSP processor described below.

2) The Sound Tools DSP, a Motorola 56001 DSP processor on a 'card' that plugs onto the Mega ST bus. This processor speeds up DSP functions, and allows things like realtime EQ during playback.

3) The Sound Designer II software. This is the software that drives the hardware described above. In addition to recording and playing back digital audio it includes cut and paste editing, scrub editing, EQ, waveform redraw, normalization, regions and playlists, fades and gain changes, smoothing, mixing of sound files, sample rate conversion, and time compression/expansion.

In addition to the components described above I also have final beta copies of the Digidesign MasterList software (For putting together a Master List of several songs with timing, blank space, etc. for a CD or tape).

If interested in this system please reply via Email to drichard@execpc.com.

Thanks,

Dean

Interviews! Important ones!

==========
INTERVIEWS Bernard van Tienen of Escom, Colin Proudfoot of C= UK
Conducted by Josh Galun and Giorgio Gomelsky
jgalun2maple.mis.net gio2phantom.com
==========

(Josh Galun, editor of Amiga Link Online magazine, and Giorgio Gomelsky of the AMUSE Amiga user group were lucky or unlucky enough, depends on your viewpoint+ to be at the hearing today...they got two candidates for interviews, too...Jason)

Interview with Bernard van Tienen ESCOM. Friday April 21, 1995
van Tienen is a former vicepresident of Commodore International.+

by Josh Galun (JG) assisted by Giorgio Gomelsky (GG)

JG How much can you say about your plans for the Amiga?

BvT We are setting up a group of advisors to advice us which products we should produce and we are digging into every product solutions not only Amigas but other products like Commodore products, TV settop boxes, we are considering PowerPCs with Amiga, we are considering everything at the moment.

JG How soon do you think youll be able to have Amigas in production?

BvT We havent decided yet, but we have all the links with the factories. Escom is a big European group at the moment, we assemble our own machines, we have all the contacts with the manufacturers, we spoke already with them, the only thing is which product should we produce, which quality an then we get started. We presume well have the first products, the first Amiga products on the market within 3 months...

JG As I understand it, ESCOM is one of the biggest computersellers in Europe, I assume AMIGAS will be in all their stores, is that true?

BvT Not only Amigas but we will also produce Commodore PCs, ja, and of course we will use our own stores in Europe but besides that we will distribute products into other countries and also to other dealers in Europe...

JG The Amiga has a very vibrant community as well as many public domain programmers, do you plan to use them in any way or contact them and ask them what they think...

BvT Of course, of course, ja...

JG With the developers as well?

BvT Ja, ja, everybody will be involved...as many as possible to advice us on the Commodore and Amiga products...

JG Do you plan to attempt to hire any of the technicians who used to be with Commodore?

BvT Of course, we are already busy with it and already have some contracts. But a lot of Commodoore people are already working for ESCOM, for instance I was vicepresident of Commodore International, Peter Tachenko... I think there are already roughly 100 exCommodore people working for ESCOM at the moment.

JG Do you have a position on whether you would license the Amiga technology and software to clonemakers?

BvT Not only to clone makers but also to people who want to produce products and need some of our licences. We are already busy with that, weve made some principal contacts, ja, on that.

JG How long have you been working to try and buy what was left of Commodore?

BvT We started with it, lets see, eh, last year in August 1994.

JG Had ESCOM been interested in the Amiga before the buyout, in having Amigas in their stores?

BvT The point is that ESCOM. ...must have lasted 3/4 years. We sold Amigas in the past in our stores...

JOSH TAKES A BREAK

GG You are aware that the Amiga has a tremendously loyal following?

BvT We know Commodore very well because I was vicepresident of Commodore International and I know everybody and everything about C= of course...

GG Do you intend to use this energy that comes from the passion of the Amiga users?

BvT Of course, of course, the biggest asset is not only the name and the products but also the usergroups. There are millions of Amiga users and even more 64 users still, ja. We are also planning to roll out products in China and other countries...

GG How would you achieve this contact with the users? Would you put up a site on the Internet?

BvT We havent decided yet but everything is possible. Also we would use the magazines of course, there are hundreds of magazines, so ok, we havent got the deal yet, but as you heard in the court now it looks like well get the deal in a couple of weeks, we have planned a lot but now well be able to roll it out, ja? So give us some time, ja, well consider everything...

GG Could the users be in touch with you, say over the next month or so and communicate their concern?

BvT Ja, we will install people everywhere, in Europe, in the States. Call me and I will tell you who and where they are. We are aware of the frustrations users had under the old management...

JOSH GETS BACK

JG Do you have any plans already in place or being discussed with CEI about working with them on the Amiga?

BvT We cant disclose that at the moment.

JG Was C= UK part of the buyout?

BvT (pointing at Colin Proudfoot passing by) Thats C= UK... "Ok, Colin, see you next week, ok?" Its not part of the deal at the moment, but next week we have an apoointment with C= to see what we can do with them. We are talking with them...

JG Do you have plans to work with them or to possibly buy them out?

BvT Both are possible...

GG My main concern is for the users, this has been a long slog...

BvT Yes, I think it is a good thing that finally there is this sale. We already wanted to buy last year, but we couldnt proceed, we couldnt hurry it up, ja, it took so long...

JG Can I ask you a bit of a personal question? Do you own an Amiga yourself? Which one"

BvT I dont own an Amiga at the moment...

JG (smiling) But youre planning on getting one, yeah?

BvT I,I,I..Ive used Amiga in the past, ja, in my office. Ill get a new one thats coming out, we dont know what spec it will be, we are working on it hard at the moment...

JG Do you have any plans to have some online chats on the Internet? Do make more use of the Internet?

BvT Of course the Internet is going around right now, its very popular in the States, also booming right now in Europe, so ja, something will happen... We will set up support groups to get to know what is going on all over the place...

JG Do you plan to make separate Amiga packages with software bundles, lets say a Modem Package, a Game Package, as C= UK has done in the past?

BvT It worked very well out in the UK, I know the figures because I was involved and everything is possible...but we can also bring out other products under the Amiga name, ja, we can also bring other technology into the Amiga, if you want, ja, we havent defined it yet but we are considering everything and we expect a lot from Commodore and Amiga, otherwise we wouldnt have bought it, ja?

: If it doesn't run Microsoft it's a dead platform (as besides
: the Apple OS, Microsoft products are the rage on Mac too).

and what u want to praesent people which DONT LIKE WORK WITH ANY MICROSOFT-PRODUCTS?:)....there are more u probably believe...
(most private owners here in germany owns pc or AMIGA, not mac, its different to e.g. usa...)

...and further..maybe u like to run unix? why u should do this
on a _slow_ pentium....and not on a _faster_ 68060er or
power-pc-amiga? (multiplatform <- amiga) and so on and so on...

and...last but not least......i can live with a well supported
nichmarket of a _good_ computer...and u can earn money in a
shorter market...too....coz u share it with fewer concurrents...
(amigamarket is not the biggest, but _not_ little....millions
of owners _are_ customers <--)

greets...

michael polasek/trans-x/commu@berlin.snafu.de/berlin/germany

You do if you want it to look remotely comparable to a laser, idiot. Learn to
READ people's posts before you spew a reply. It will use any paper, but
you need a paper where the ink will not bleed in order to avoid it looking
much worse than a laser. trust me on this. I've got both a canon BJ-200
(exactly like a stylewriter - even tha same case) and a Dec laser printer.
The dec, even though it has a lower res of "only" 300 dpi vs the 360 of the
canon, looks better because lines to not waver as the ink runs along the
grooves of the paper.

>A 600DPI laser will set you back $900 with postscript. For my needs a Inkjet

A reasonable thing to say, but a $500 laser at 300 dpi with postscript will
look better. You get what you pay for...

1173. Re: SINFLOP FLOPS AGAIN!!!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1995-04-24 00:00:00 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3ngekb$180@ccshst05.cs.uoguelph.ca>
Source record: 12874

: Inkjet printers have improved in technology and price. Apple has just released
: a replacement for the StyleWriter II with the StyleWriter 1200 for $269 list.

I can get a Cannon inkjet for $259 Canadian. In terms of
technology it has improved, but cheap bubblejets do not approach the DPI
of laser printers.

: My inket the StyleWriter II uses printer paper and photo copy paper. I don't
: need special coated paper, DUMBASS!

Neither do most bubblejets.

: Not many..

Figures please? Why don't you check out some European Amiga mags.
This claim is likely to be refuted.

No Peter, you are a total wanker. And do the Amiga groups a favour, piss
off out of them.

Still, at least if you are spending your time antagonising people here
we don't have to put up with your puerile posts too much.

: now.

Hmmm, so it's 'official' then? The Atari computer line is no more..
Ironic, as it looks like the Amiga _might_ be about to be reborn. The
rights were bought by a German company ESCOM last friday. Rumours abound
over what they will do with it. It'll either be a case of them manufacturing
them in China _or_ there have been rumours of them selling the rights to
manufacture on to a 3rd party like C=UK or CEI. Basically, they could well
license Amiga clones.

Yes. This is amazing. I remember some official Atari reports quoted in this
group where you could read that only a small amount of Falcons were expected to
be sold. It sounded like the Falcon was born to lose. I don't understand this
behaviour. Did Atari think the Falcon was coming too late ? Too late for the
market and too late to stop the small production ? I'd be curious to hear an
official explaination.
But I don't agree with you when you say that it was obsolete. It wasn't at the
date of first release. Even now, I find it would still be a good choice.

Well, not totally official, but pretty much a write off. Atari
still makes a few Falcons and TT's for developers, hobbyists and
musicians. Very little is actually put into the computer lines these days.

: Ironic, as it looks like the Amiga _might_ be about to be reborn. The

The Falcon was over a year late from its initial intended shipping date.
ATari knew that by then it would not be a good competitor as it had lost the
"we're the first DSP home computer" edge and they had to use its advertiding
money to keep the company afloat. Naturally they would have spent as little
as possible after that (read: make few machines, save manufacturing costs)
and waited for the Jaguar.

Not so paradoxical. I see a good reason for Peter to pray for the rebirth of the
Amiga: what could he bash if there were no more Amigas and Ataris ?

As far as Atari making Falcons, it's pretty much as we've expected it to be
since the introduction of the Jaguar: THey aren't making any more computers
for the immediate future. C-Lab bought the rights to the Falcon and are
already beginning to sell it under their name. The price is high, but if it
catches on, it should come down and many improvements are slated.

Escom bought the Commodore name because of its perceived value in Germany. Escom is a one-two billion company and the second largest PC manufacture in Germany. Escom stated that the existing models, the A1200-A4000 will be put back into production with in 3 months. Escom plans to bring out a C= labeled PowerMac clone..

I am an electronic musician and pseudo-wannabe hacker (electrical engineer by trade). I have a small recording studio in which I use a PC for sequencing. I am thinking about getting into real computer music; actually writing code to generate and process audio. I could get a soundcard and a big HD for my PC, but I have heard that the Atari Falcon is a good machine for computer music. I have also heard that it is not well supported for general purpose software, but that is really no concern of mine. (I would not be getting rid of the PC--it's really my wife's--if I get a Falcon).

I would like basic info and opinions about the Falcon, as technical or subjective as you like. I would especially like to see specs on cpu power/speed, dsp chip specs and general programmability (assuming it has one), i/o ports, and general audio capabilities--does it have a built in ADC/DAC; are there 3rd party soundcards available; and finally what software exists for generating (like Csound, Cmix, MAX etc.), recording and manipulating audio.

If there is a FAQ that contains this info, please advise; although I do not have access to most ftp sites because of company security resrictions. If someone were to mail me such a FAQ, I would be very appreciative.

: As far as Atari making Falcons, it's pretty much as we've expected it to be
: since the introduction of the Jaguar: THey aren't making any more computers
: for the immediate future. C-Lab bought the rights to the Falcon and are
: already beginning to sell it under their name. The price is high, but if it
: catches on, it should come down and many improvements are slated.

I'm sure C-Lab are well intentioned. The problem is marketing and price.
I doubt very much that they have the resources to market the product
properly. Also, in the long run, for new software to be developed we need
a large(ish) user base. Hence the price will have to be comparable to
the new Amiga 1200+ (or 1800), if and when it arrives.

The other thing is Atari apparently had two other Falcons in various
stages of development. These or similar will have to be released in the
next year ro so, otherwise we'll fall even further behind.

Hello !

I perhaps want to buy a Apple and use both Apple software _and_ MagicMac.
But as I have stated earlier, the apple computers here in Germany are not
so cheap compared Atari clones. But the prices stated in this group for the
US sound interesting. E.g. Quadra 630 for 1000$ against 2200$ in Germany.
My question is, can I buy such a computer in the US and transport it to
Germany easily ? And do I have service by an Apple customer in Germany,
I mean warranty ?

I don't know what you mean by definition of "dead." As far as applications software, all everyone is grabbing for is Microsoft. It may be "less than ideal" but cerainly not "dead." I'd say that "dead" means that you can't get any software, or new hardware to a lesser extent - not the case with the clones....

> MICROSOFT is good for the people pocketing your cash cause
> you're too stupid to buy something good for you!

True - pocketing a lot of cash. The reason I've started to use Microslop is because it's what's readily available. If there was better available at a reasonable price, believe me, I'd take it. I also like Microsoft Word because I can take my huge text files to school and print them out there, on THEIR laser printers and papers. Why would I want to punish mysself and lose this ability? Again, I don't have to think it's perfect to use it.

> microsoft DOES NOT have
> the consumer interest in mind, they have business interests in mind, they
> don't care if you are screwed into buying new hardware, it only makes
> them look good to their industry peers.

TRUE....VERY TRUE!!!!!

They are a shell with very
> little real talent at the core, Just like Windoze is a SHELL!

Again....true... However, if I just "don't think about it" it doesn't bother me too much - and it has managed to get the job done. I've been using Microsoft Word - mixing text and graphics for my lab reports - and the outcome is really spiffy. I really DON'T WANT to blow the Microsoft horn, but hell - my lab reports do look a lot better than with 1st Word. I had to clear my mind of prejudices and just do what would serve me cheaply and effectively.

> Wake up and stop buying microsoft, the industrty will program for
> what gets sold, they don't care what it is! YOU decide what platforms
> get support, if you let the trends decide you are a sheep being fed hogwash.

Actually, I just have to buy what software is available. If the most is available for WindoZe or DOS, then that's what I have to deal with. Since that's the platform with the most support, what else could I have done? I could have bought a Falcon for MORE MONEY and had little to run on it. I'm not knocking the Falcon, but there is a software dilemma. The best hardware in the world is useless to me without software that meets my needs, or makes things easier. Converesly, DOS/Windows hardware, while less-than-ideal, goes a lot farther with all the programs I can pick from. It's the sad truth.

> if you babble that Windows 9x vapourware is "going to..." whatever, you

> IBM and OS/2 if your head is stuck in your clone box.

I've looked at OS/2 - but since my needs are minimal, I don't feel like having to buy MS-DOS, WINDOWS, *and* OS/2 - simply so I can run OS/2. My applications programs won't run any better under OS/2 - no matter what the multitasking kernal may be - 'cause I don't multitask nor do I care.

> We need one computer platfrom like we need one car manufacturer,
> competition is GOOD. Think if Mercedes had to descend to conform to the

>

Well, a proprietary computer is like a car that requires a special road - or that has no roads at all. It would be like taking a Lamborghini back to 12th century Europe..... good luck finding gas and a road to drive on. The analogy between cars doesn't work too well, because both Mercedes and Peugeot can drive down one type of paved road. Unfortunately, software is just a little more specific to hardware than roads are to the brands of cars.

BobR <76702.1466@CompuServe.COM> writes:

:>BTW don't you have better things to than stick up for Petey?

:Hey.. when you're wrong, you're wrong... and Tom, you're wrong...

:Like I posted here before, pick up the April issue of Computer Shopper and
:check out the ad for Tri-State Computers in New York City...

:Panasonic 4400 Laser Printer: $299
^^^^

Are you sure? They have the exact same laser printer listed in three
different mail-order ads in PC Magazine. One charged $450 for it, the
other two charged $350 (and mail-order firms aren't known for being
expensive). Perhaps Tri-State is a shady source.

In any case, maybe you are right that their are a handful of laser
printer models you can get for $300 in a few select stores. In that
case, I was wrong in saying that there are no $300 laser printers.
But that does not make Peter right since he wasn't referring to laser
printers (see below). And it is true that the vast majority of laser
printers sold cost at least $400 (I bet that these $300 models,
assuming they exist, are garbage).

:Less than $300, just like "Petey" said.

:And no, Petey didn't say "Mac" laser, or DeskJet.. before everyone started
:twisting it all around, he said "you can get laser printers for less than
:$300"...

I recall that he said "You can get a laser printer for the Mac for less
than $300." I am sure that their are others who can back me up on this.
And why would Peter quote the prices of these $300 printers if they weren't
Mac-compatible, especially since he was trying to argue in that post that
Mac peripherals weren't any more expensive than PC ones.

But all the above is MOOT because the $300 "laser" printers that Peter
was referring to were inkjets! Even he eventually *admitted* that (and
Peter isn't one who admits to mistakes easily). And if he actually was
referring to true $300 lasers in his posts, why would he have expended
so much effort in arguing that an inkjet is essentially a laser because
it's "just as good"? If there are (as you say) actually $300 laser
printers out there he was still wrong because THOSE WERE NOT THE PRINTERS
THAT HE WAS REFERRING TO!

:Looks like he was right... looks like you were wrong.

#Sinclap imitation mode ON

Looks like you're an idiot.

#Sinclap imitation mode OFF

How can you say he was right when he wasn't even talking about the
right kind of printer.

Don't give up, James. The fight is not over.
A more realistic analogy with cars would be a car with a diesel engine in a world of gasoline cars. Of course, having several standards is still possible.
By the way, the car analogy made me think to something: I don't know whether it is the same in the States, but here, all cars tend to look the same: most of them have this bended shape, and only the size seems to differ. This looks quite revealing about the standardization of the present times. It seems the 90's will be ruled by conformity, just like the 80's were the years of individualism. So you can all go and buy your standard Personal Crap or your Macinflop just like sheep. And go to hell.

Pascal.
PS: Sorry, Macinflop is not a standard. Beware of the fall.

No. We have 220V. But a few weeks ago the university buyd a reactor for
chemical investigations in US with an Apple computer to controll it. The
power supply of the computer switched automaticly between 110 and 220 V.
So I think I can use it here for my one two. Only the monitor was only for
110V and we have sent it back. Still the question: Do I have service and
warranty in Germany ?

While I'm not going to dispute your observations, what would you have
posters post about on an "advocacy" newsgroup? Have you looked on any of
the other .advocacy newsgroups? Seems like this is the stuff that
.advocacy neswgroups are made of. Perhaps you should avoid this one if
it gets to you. Just a suggestion.

1217. FS: Digidesign Sound Tools for Atari Mega ST

Newsgroup: comp.sys.atari.advocacy
Date: 1995-04-28 00:00:00 UTC
From: drichard@execpc.com
Message-ID: <3npq3l$9tb@homer.alpha.net>
Source record: 12918
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st,comp.sys.atari.st.tech,fr.comp.sys.atari,rec.music.makers.marketplace

For Sale: Digidesign Sound Tools system for Atari Mega ST. Note, this system REQUIRES a Mega ST because the DSP board plugs directly onto the Mega ST's bus. I paid over $2000 for this system, and am asking $450 or best offer. It's in very good condition and comes with original manuals, etc. If you're unfamiliar with the system, here's what it does:

The Digidesign Sound Tools system is a hard disk digital audio recording, playback, and editing system. It can be used for mastering CD's, tapes, etc. or for editing digital audio. The system I'm selling consists of the following 3 components:

1) DAT I/O digital interface for doing direct digital audio I/O (entirely in digital domain) from DAT, Mini Disc, DCC, or a CD player that has digital output. It has both AES/EBU and S/P DIF ins/outs. This is a separate box with cable that plugs into the DSP processor described below.

2) The Sound Tools DSP, a Motorola 56001 DSP processor on a 'card' that plugs onto the Mega ST bus. This processor speeds up DSP functions, and allows things like realtime EQ during playback.

3) The Sound Designer II software. This is the software that drives the hardware described above. In addition to recording and playing back digital audio it includes cut and paste editing, scrub editing, EQ, waveform redraw, normalization, regions and playlists, fades and gain changes, smoothing, mixing of sound files, sample rate conversion, and time compression/expansion.

In addition to the components described above I also have final beta copies of the Digidesign MasterList software (For putting together a Master List of several songs with timing, blank space, etc. for a CD or tape).

If interested in this system please reply via Email to drichard@execpc.com.

Thanks,

Dean

I can't understand all this Amiga-hopefullness from Sinflop. What is it, Sinflop?? Do you want the Amiga to linger around to give you someone to pick on??? Ha ha ha!

I just can't see ANYWHERE for the Amiga to go. I feel there will likely always be a Macintosh around, simply as an alternative to the PC. It's actually good to have the competition between platforms to fuel the improvements of both platforms, but I really don't see room in the industry for a third player.

Why? Unlike the Atari computers, the Amiga *was* marketed very well. As an Atari user, I have been "jealous" of the Amiga developments for years! All those options and slots and peripherals - innovative new machines based on the 020 (Atari never used) and 030 (years ahead of Atari). Hell, I can't imagine WHAT Amiga could have done better.... Having said that, I don't see what it is that this company BUYING THEM OUT hopes to do better.

A business flops because (1) the market wasn't handled properly, or (2) the market simply wasn't there (in enough numbers). I believe the Amiga situation withered away to scenario #2.... You can still see in on comp.forsale.amiga (or whatever) as people continue to "bail out" and go PC or Mac from their Amigas. It's just a matter of time until PC (or whatever replaces it) and Mac go head to head like VHS and Beta did on VCRs. Despite the fact that Beta had a better picture (supposedly - I never owned one), VHS won. Who's to say that the market operates entirely logically? However, the PC is the more ubiquitous of the two main competing standards in personal computing. Where is the Amiga going to fit in? Where are users going to find hardware and software for their Amigas? THose places that recently dumped their Amiga product lines most likely have NO INTENTION of starting up again - or why would they have dropped them to begin with?

I think it's great for those who love the Amiga that someone is trying to make a go of it again, but all the evidence clearly indicates that there is no room in the market for another player, or Amiga would never have gone tits-up to begin with. All the Amiga will ever be (from now on) is

a small-niche hobbiest machine. That's great for that small niche of hobbiest machines, but please let's not blow this Amiga thing out of proportion and act like it's coming on strong as another standard....

James

> Actually, when cornered, pete admitted he meant inkjet.

True... after being badgered about it, he began to sound a little confused about what he meant to say.

If he indeed originally MEANT to say inkjet instead of laser printer, it means he was right without realizing it.

My original point in the thread was that he SAID you could buy a laser printer for less than $300 and all the schoolyard bullies jumped on him and said No You Can't... turns out the bullies were wrong, regardless of what he meant to say.

It may not be a stupid move at all. I have had students from LDCs (less developed countries) and have read their newspapers. There is a desperate need in LDCs for a cheap, cheap, cheap computer line. Reading newspapers from Dhaka, Bangladesh, I noticed that the only computers available were from the BIG manufacturers (Apple, IBM, Compaq, etc.) and computer classes were only for top of the line programs (MS Excel, DBase IV, etc.). In short, the only "western" computers available to them are so high priced as to be impossible to buy. I have a student from east Asia who worked for a corporation with thousands of employees and only 4 PC clones in the whole organization.

If Escom can put out a C-64 or Amiga 600 unit that can be stamped out in China for less than $200 or so...the market is WIDE open for them, particularly if they can put out something than can output to a TV for starters and show the native language (Chinese, Bengali, etc.) on screen. They could sell millions of them.

As well as being ready to ship it was the only way that Atari could
remain a brand name until its wonder console was released. Also
Atari MUST have been selling it at a profit so although as a whole
Atari corp was losing millions it was atleast earning some revenue from
one product.

At the time of the Falcon release Atari had another console called the
'Panther', I think although I may be wrong that this was basically an
enhanced ST(e). However the Falcon was superior, and the Panther was
dropped.

It worthg noting that during the early years of Microsoft it was
infact C= that helped to keep him afloat. A payment of $10000 (I think)
from C= for the right to use MS Basic on the C= Pet, helped the then
not so ell off Mr Gates through a rather tough time.

^^^^^^

That's a little overly broad, don't you think..? I'm looking at a page
of output from my DeskJet and I don't see any smearing at all...

The dot size is bigger than a laser's output, sure.. but it doesn't
always smear...

>etc.), recording and manipulating audio.

16 MHz Motorola 68030
DSP Motorola 56001, 32 MHz
General programmability: well, assume a DOS/GEM machine, just with an 68030 CPU. Nice tools making GEM programming more efficient under C or Pascal are readily available, a replacement for TOS (the DOS equivalent) with multitasking capabilities is Freeware(!) and the Falcon ships with an AES supporting this replacement (MiNT). Of course, considering the CPU performance, Assembler and DSP assembler are used for development of these nice music applications, mostly.
I/O: Centronics, RS232, SCSI, internal IDE (2.5"), joystick (Jaguar and VCS 2600 compatible ones), monitor (RGB, SM124 compatibles (great small b/w in 640*400/72 Hz), VGA), DSP port(!), mouseport (Atari specific, similar to C= Amiga). Analog I/O for sound with 16 bit ADC/DAC, but with bass booster (:-(). No third party boards (what more than 16 bit 50 kHz do you need?). Syncing the DSP port to DAT (48 kHz) or CD (44.1 kHz) is done by S/PDIF interfaces.

You should get one with 14 megs of RAM and a large SCSI harddisk for serious work, preferrably a Falcon MkII (internal SCSI, no IDE)., if you can get your hands on one, this one even has better (linear) analog sound I/O, AFAIK. and is said to get a second DSP in the near future.

Software: the best piece here is Cubase Audio 16 from Steinberg, of course, but even in the Freeware/Shareware area, there are programs like WinRec/WinCut (harddisk recording), etc..

The German professional magazine "Keys" answered the question if they had any objections against using a Falcon as a CD preprocessing machine with the statements that they consider it perfectly fit as studio equipment.

> :Panasonic 4400 Laser Printer: $299

> Are you sure?

No, I'm lying.. and the source I quoted doesn't go to several hundred
thousand people who could check by opening the magazine.

> They have the exact same laser printer listed in three different mail-order
> ads in PC Magazine. One charged $450 for it,

You're reading the wrong magazines then.

> In that case, I was wrong in saying that there are no $300 laser printers.

In that case, it sounds to me that Petey was right.

> But that does not make Peter right since he wasn't referring to laser
> printers

Nope... regardless of the way you choose to remember it, he said you could
buy laser printers for less than $300. I don't really care if he had a
picture of an Underwood Manual typewriter in his mind when he said it, he
SAID "Laser Printer".

You said "No you can't"

You were wrong.

> I recall that he said "You can get a laser printer for the Mac for less
> than $300."

Interesting that you put quotes around that line.. you must be VERY sure
that's EXACTLY what he said. That's not the way I remember it.

> I am sure that their are others who can back me up on this.

No doubt. The Atari Bully Boys stick up for each other.

> And why would Peter quote the prices of these $300 printers if they weren't
> Mac-compatible,

Like I said, I have no idea what's compatible with a Mac and what's not. All
I know is there's a laser printer that can be bought for less than $300,
just like Petey said.

> why would he have expended so much effort in arguing that an inkjet is
> essentially a laser because it's "just as good"?

Because that's the way the discussion wandered off once the Bully Boys
started twisting it, after declaring that you could NOT buy a laser printer

for less than $300.

> If there are (as you say) actually $300 laser printers out there he was
> still wrong because THOSE WERE NOT THE PRINTERS THAT HE WAS REFERRING TO!

(That's right.. I'm still lying about that) Like I said, I don't CARE what he was "referring to"... he was still right about $300 laser printers, and YOU were wrong (regardless of what he "meant", you were STILL wrong when you said there were no lasers for less than $300.. nice try, but you can't weasel out that easily.. you were wrong.)

> Looks like you're an idiot.

Looks like you're an Atari Bully Boy who's never wrong, right?

> Mind disclosing your true identity, Bob? At least Sinclap has the courtesy
> of posting his garbage under his real name.

> * Tom

No problem.. my name's Bob...

Ah... so anyone who disagrees with you, or has the audacity to prove you wrong in anything posts "garbage"...

It's too bad the other Internet service provider I use doesn't bother with atari.advocacy, as they archive messages and I could quote EXACTLY what Petey said in the discussion of serial vs. parallel printers about the price of laser printers.

(I see that I forgot to have the mailer here tack on my "real name".. I'll have to remember to do that... so just for you, Tom...

My name is Bob Retelle, I'm a Sysop in the CompuServe Atari Computing Forum and the Atari Gaming Forum...

I won't bother with the rest of my "credentials", but you might say I know a bit about Atari and Atari computers.

What ANY of the garbage I've been seeing on "atari".advocacy recently has to do with Atari is beyond me...)

James Wood (jamesw@PEAK.ORG) wrote:
: While I'm not going to dispute your observations, what would you have
: posters post about on an "advocacy" newsgroup? Have you looked on any of
: the other .advocacy newsgroups? Seems like this is the stuff that
: .advocacy neswgroups are made of. Perhaps you should avoid this one if
: it gets to you. Just a suggestion.

I am quite used to - and have no objections to - the rational and logical (or at least the somewhat intelligent) exchanges relating to the pros and/or cons of the topic at hand -- in this case, Atari computers. What I object to is the constant, unrelenting personal-insult-laden chatter which has little or no bearing on the topic at hand.

"Atari is dead!"
"No it's not!"
"Screw you, you're a jerk!"
"Yeah? Well, you fornicate with animals!"

Etc etc, ad nauseum. (I realize this isn't nearly on par with the content of some of the messages posted here; I provide this merely for example.)

It looks like Mr. Sinclap has lots of people eating right out of his hand. He _wants_ people to fight with him, regardless of the topic. Doesn't anyone other than I see this? I personally have written Mr. Sinclap a clearly worded request, in mail, that (in essence) he make an attempt to behave himself here. As he has not responded to my message and, for all intents and purposes, seems to have ignored its advice completely, I can only assume that he is content with his role here. And that role is, from what I've seen, stopping all attempts at communication and turning as much of this newsgroup as possible into a shouting match for five-year-olds. And (unfortunately) it works nicely. It seems like so many people in this newsgroup are either (a) paranoid about being lambasted about owning/using an Atari, or (b) so intent on stalking Mr. Sinclap that they pounce on him repeatedly for the slightest misdemeanor - most of which, I'm certain, were parceled out simple because he wanted the controversy (read: attention) focused on him.

Asking everyone to ignore Mr. Sinclap wouldn't do any good, as we all know. Invariably, someone would be inable to maintain "radio silence" and Mr. Sinclap would get the attention he so desperately craves. Unfortunately for the rest of the people who read this newsgroup in search of answers and information, the childish banter invariably drowns out everything else, leaving nothing but net static behind.

Here you go jumping off the deep end again in anti-Microsoft fashion....calling me brainwashed; saying that I never buy anything that has $100 million in advertising. Wherever do you get such off-the-wall notions? I said I USE WORD BECAUSE IT'S COMPATIBLE WITH JUST ABOUT EVERY OFFICE/SCHOOL COMPUTER THAT HAS A LAZER PRINTER IN FRONT OF IT!!! I can mix text/graphics seemlessly, take it in to the school and print out my lab reports on their $boucoup-thousand$ Laser printer.... It beats using 1st Word (or any proprietary WP on a proprietary computer) because I can do that easily. Period.

Did I say anything about "needing to run Word to have a useful, worthwhile home PC?" I think not. Would you care to quote me if you beg to differ? Unless you can re-post and quote me saying that, you've stuck your foot in your mouth and demonstrated that YOU are the one who is dim. On the other hand, do you care to dispute the fact that a home computer that DOES run Word *is* a useful machine??? What's your point?

What is the standard for business doesn't necessarily NOT make for a home computer. You know what makes for a home computer? SOFTWARE!!!! SOFTWARE!! SOFTWARE!!!! Care to dispute that? Care to dispute that these "business" computers have a lot of HOME software? Again, what is your point?

You can't get any software for it, either. As a consumer, I don't give a **** what the platform is; I am loyal to NOBODY (unlike some folks, it seems) and I run (1) WHAT'S CHEAP, (2) WHAT'S READILY AVAILABLE, (3) WHAT HAS SOFTWARE READILY AVAILABLE, (4) WHAT DOES WHAT I WANT IT TO DO WITH THAT CHEAP, AVAILABLE HARDWARE AND SOFTWARE. From now on, I don't care who makes it, what label you put on it. If there's a time when a Power PC Macintosh meets all those criteria, this Pee Cee will go in the s*itbox with all my previous computers. I'm never showing "loyalty" to any computer platform or brand again. Let the hardware and software serve me, not vice-versa.

James

Its kind of nice to insert your disk on the campus wide computer network to get
the job done. Can't say that for the Amiga.

Yep, I agree with that. The only thing that the Amiga is useful right now,
hmmm I am scratching my head to find it, Wait here it is: Format a disk and
play an Atari 2600 style game..

The mouse type pointing device and the majority of the WIMP interface
basic concepts were developed by the Xerox company (yes the photo-copier
people) an the late sixties/early seventies at their Paulo Alto research
centre. This info actually came to public attention towards the end of the
Apple/Microsoft legal wrangle over who 'owned' WIMP enviroments as a concept.
Neither of them won, I believe Xerox basically made the concept some kind of pu
lic domain 'idea'.

I am not saying that Xerox actually invented the 'mouse', they probably
used b I am not saying that they actually invcented the 'mouse', they
probably used track balls or similar, but you know how James Burke always
liked to connect these things!

Does anyone know if this is true? Also does it apply to the UK
office, or just the one(s) in Holland?

: thanks.

I would imagine Xerox-Parks Corp, as they originally invented the
WIMP environment.

> I would have thought C-LAB would have improved the CPU like to say ...

At the moment, the C-Lab Falcon is virtually unchanged from the Atari version. They're including a bigger hard drive, and I believe they've made a few changes to the sound output.

There's talk (there always is) about upgraded models in the future.

> The machine won't be developed as a computer,

I don't think C-Lab has any aspirations of developing their Falcon as a general purpose computer. After all, they're in the music business, and are pretty much just selling the computers so their main product, their music software, will have something to run on.

As a niche product, for a niche market, it may be viable.. but for anyone to pay the price, just to get a hobby computer, will be quite a stretch.

Listen, Peter. Are you able to post a message which is not full of contradictions
or useless figures ?

First, I agree with you when you say it's Atari's fault. But it's not only their
fault. OK, I have never seen any Atari TV-ad here (although there used to be a
time when one could see some), but I feel lucky to have never seen any silly
Atari TV-ad like those I saw for Mac and IBM. Since I've seen the latest IBM ad,
I feel ashamed when I must confess that I work in computer science. Apple or IBM
consider their users as dumbass' ? Well, I'm glad (not surprised) to see that
these computers meet your poor user needs.
But Atari's mistake was certainly not an eventual bad handling of the ST. There
is one thing you must understand: many ST were sold here, particularly in France
and even more in Germany. They sold far better than the 400-800 and XL series
(which didn't seem to be a success here, I must acknowledge). I don't know those
figures you seem to love so much, but the number of ST sold was by far more than
'not many'. Not being sold in the USA doesn't mean that it was not a success
elsewhere, and as you like to say: GET OVER IT ! I won't make any assumption
about the success difference of the ST in Europe and in the USA, but it would
surely be very interesting to investigate. Luckily, the States don't seem to be
only populated with people like you.
No, if Atari made a mistake, it was the late design and release of the Falcon.
Then, for how long haven't you seen an Atari app ???? If I remember one of your
incredible postings where you made yourself so ridiculous, we should count in
years. And if this 'poor quality of apps' had existed, would it be Atari's fault?
If so, please explain it to me. And please don't invoke technical reasons or I'll
explain to you why a PC is crap, technically speaking.

So, the PC meets user needs ? Peter, have you ever used a PC ? I mean, really
used, not only pressing mouse buttons ? I guess you've never tried to program with
PC, and even less under Windows. Of course, it's very easy to say that a computer
meet my own needs, if I don't know anything else. How many PC users have ever
used a ST ? Figures are welcome (I could say 'not many' but I won't).

I won't say anything about the Mac. There has been too much talk of it in this
group.
I agree that Sun meet users need, but those needs are very specific: it is a

workstation, not a home computer. Your argument is irrelevant.

Next, the Amiga. Hum. Yes. Another choice. Excuse me Peter, but don't you have the feeling that the Commodore situation is worse than Atari's ? Please don't be an asshole replying with 'Not for long'. So why should I have more trust in a machine quite 'similar', which used to be produced by a company that sunk, than in a computer whose company still exists, even if the current model is not produced any more ?? Do you enjoy your mental illness talking of things you don't know, gratuitously bashing Atari and Atari computers and console ? Are you...
< > really stupid
< > trying to cure life frustrations with Atari bashing
< > trying to get others's attention to show that you exist by posting crap in this group
< > just here to make people laugh at you
< > only a Mac user
< > an asshole ?
Please mark the relevant box. Multiple choices allowed !

Now, Peter, listen. If I buy a new computer:
- it won't be a PC. I meant a real computer.
- it won't be an Amiga. A good computer, but is not yet reborn.
- it won't be a Mac. I don't want to catch the Sinclap.

It will be a Falcon, for the simple reasons that, even slightly outdated, it still has real new capabilities and allows me to reuse most of my ST games and apps. And, moreover, I don't want to be a sheep attracted by the meaningless 'security' and 'quantity of applications' of other platforms seen on TV.
Will you be happy when only one computer platform will remain available on the market ? "I've bought the newest MACPC! It's the best model: it won't be outdated until 6 months !"
Ah... freedom of choice...

Have a nice day, Peter, and get lost.
Pascal.

PS: being called 'stupid' by you is a great honour. Thank you very much ! I feel flattered.

:BobR

So, Bob, what does the fact that Sinclap said the right thing COMPLETELY
BY ACCIDENT say anyway? It certainly doesn't say anything positive about
his intelligence. All it says is that he was lucky this time, that's all.

Rest assured, though, that soon enough he'll make another such mistake and
that time he probably won't be bailed out by some sleazy fly-by-night NYC
retailer listed in Computer Shopper that more likely than not got its
merchandise from some very shady sources.

Tell me if this store is listed in next month's Computer Shopper. If it
is, it is probably a perfectly legitimate (and very price competitive)
retailer and my comments were uncalled for. Otherwise, I am probably
right.

As for us being "school-yard bullies" beating up on poor little Petey,
he asks for it. In fact he relishes it. If he didn't enjoy getting
roughed up by everyone else on the 'Net (Jeff Minter put him in the
hospital the last time he started causing trouble in the r.g.v.atari
school yard) why would he stick around? Think about it..

BTW I am still waiting for you to reveal your true identity...COWARD!

I'm no Amiga hater, but what makes you think the Amiga has much of a chance
of succeeding, especially after its been left to rot for over a year? I
find it interesting how you attack the Amiga in the c.s.amiga hierarchy but
praise it here.

:> Pascal.
:> PS: Sorry, Macinflop is not a standard. Beware of the fall.

:Its nice to dream..

He's right. The Mac ISN'T the standard. For all intents and purposes,
PC's with Intel-compatible processors running Windows are. If you doubt
that, go to any general (not Mac-only) computer store and observe how
their PC stock outnumbers their Mac stock 4-1.

Now, back to studying for finals...

It tried. One day I failed: it was too much.

|> Unfortunately for the rest of the people who read this newsgroup in
|> search of answers and information, the childish banter invariably drowns
|> out everything else, leaving nothing but net static behind.
|>

On the other hand, there is a great need of discussion in this newsgroup. If we
all were here to say "My Atari is good, I like it, everything is allright", this
group would lose most of its interest and fewer messages would be posted. Even
if we know that not everything's allright with Atari, we need people to discuss
the facts, to demontrate why Atari is not such a good choice (which Sinclair is
definitely unable to do).
But we don't need any child who posts Mac prices lists and Mac news, which are

totally irrelevant in this group, or things like "Atari sucks", "The Jaguar is a flop", "the number of units sold are: not many", "Apple has earned X $". This kind of posting has nothing informative for us, Atari users. This is how starts an infinite thread about printer prices. That's why we don't need Mr. Sinclair here.

Pascal.

Well, I was talking about the Intel computers - that is what Mr. Gavan
was knocking.... He calls them "business" computers and his contention
was that they aren't good in the home. He's still thinking like 1985.

> However, the PC, being ONE (not the only one) of the business standard, is

> Windows, and Intel programming, of course.

Exactly - 10 years ago, the Pee Cee SUCKED for a home computer. That's
what it seems a lot of proprietary Pee Cee haters have forgotten - old
reasoning from 10 years ago doesn't apply today. They have this "PC
hatred" in their blood for so many years that it has clouded their
judgement. They also still have "loyalty" in their blood to their
particular brand names....a very SILLY notion which clouds their
judgement even more.

I know that there are a lot of things that **DO** suck about the Pee Cee
- the memory juggling/TSRs/IRQs etc. Fortunatley, these only happen when
you add/change a peripheral. NOTE: THEY ARE EASY FOR ME (BOBR) BUT I
MAINTAIN THEY AREN'T EASY FOR LOTS OF HOME USERS...PERIOD. There's a lot
of knocking of MS-DOS and WindoZe, but with WindoZe you just point your
mouse like any other GUI and if you quit bitching, you'll find it can get
the job done.

If you're not a programmer, then you just open the software package, put the floppy or CD-ROM in and go to town...there's no "Intel-specific" woes for you to deal with - the software author has taken care of that. If you're a programmer and you want to tap the biggest software market (and it appears that many do), you learn to deal with the "Intel woes" that PC haters bitch about, or you write for a proprietary computer and sell a few copies of your software.

> |> If there's a time when a Power

> good chance that you'll like its follow-up.

Well, I was for years. I still think that IN RETROSPECT, the ST was a *fantastic* computer....it was absolutely mahvelous. I used it for years. However, would upgrading to a Falcon have been loyal? Atari isn't even around as a computer maker, so how could I be loyal to a division of the company that doesn't exist? Also, while some of my old software would work, it sounded to me like MOST WOULDN'T. What software did I want that would work? Well, the OLD GAMES would be nice - but lots of games don't run on the Falcon. As I understand it, the applications software would be more successful, but my applications software was old and lacking by today's standards (1st Word, for instance). I wanted to get the word processor Papyrus, but it cost $179 from Toad. Hell, my ST wasn't worth $179. Hell (again), students were buying the COMPLETE MICROSOFT OFFICE for that same price at the bookstore...for their Pee Cees and Macs. Finally, the underpowered Falcon (by today's standards) cost SIGNIFICANTLY more than either a modern Mac or PC with many times the capabilities - and I'd still be in the same software dilemma that my Atari kept me in for years. I wanted (have now) an Epson Stylus Color printer. Would I find Falcon drivers in the box with the printer? NO! Are there Falcon drivers? WHO KNOWS! Would I need Falcon drivers for 1st Word and Papyrus? PROBABLY. Are they available? WHO KNOWS! PROB. NOT! I wanted to run some CD-ROMS for reference (games too) and I don't think there are enough Atari CD-ROMs to justify purchase of a CD-ROM drive for an Atari. They give them away (and CD-ROMS too) on the Pee Cee.

It just became TOO MUCH WORK to be an Atari user for me. It seemed I was the one who had to do the seeking for what I needed, and if I just cleared my head and went with one of the "enemy" computers, everything I could possibly want to do could be done (1) easier (2) better (3) for less money, and (4) be compatible with other computers.

I still say that the ST is a fine computer, and I don't mean to knock it. However, in 1995 I took a look at where the rest of the industry was

going and I say "If you can't beat 'em, join 'em." Now my computer serves as a slave to me once again, rather than vice-versa just so I could stay under a particular brand label with a Fuji on it.

James

|> computer. You know what makes for a home computer? SOFTWARE!!!!
|> SOFTWARE!! SOFTWARE!!!! Care to dispute that? Care to dispute that
|> these "business" computers have a lot of HOME software? Again, what is
|> your point?

Sorry, James, but this is not true, for the simple reason that software depends
on hardware. I wish I had Doom on my Sun workstation. But it's not the lack of
that kind of software that makes a Sun worksation not convenient to a home use:
it's the hardware (and the OS) that makes programming of that software very
difficult. Moreover, where could I plug my joystick in ?
However, the PC, being ONE (not the only one) of the business standard, is
also well suited for a home use. This has not always been the case. In the early
80's, the PC was mostly destinated to the business market, due to its price and
its hardware: the lack of joystick port, the need for a monitor, the poor video
resolution made it a bad choice as a home computer against Ataris, Commodores,
Apples and so on, although those computers had less software (I forgot
the little internal speaker: remember ? CROUIC ! BBBZZRRT ! CRRRRR !). But things
changed and PCs got sound cards with joystick ports, prices dropped down, making
it nearly a decent choice for both professional and home use (but not the best
choice as a home computer OR a business computer), if you can cope with MS/DOS,
Windows, and Intel programming, of course.

|> serve me, not vice-versa.

I thought many Atari users were loyal to Atari. Maybe it's less true as each day goes by. Upgrading to a Falcon is not only a question of loyalty: it allows you to reuse a good number of ST software. And if you liked a computer, there's a good chance that you'll like its follow-up.

Farewell,
Pascal.

Ha ha. Nice interjections of your personal opinion there..."wimp." I disagree completely. Perhaps you like to make 14-20 keybangs to change into subdirectories that may or may not be nested....I rather think one bang of the mouse button is a better solution.

James

Atari Advocacy in my newsreader is defined as defending and attacking atari computers. its natural for people to get personal in advocacy.

1253. FS:Digidesign Sound Tools for Mega ST

Newsgroup: comp.sys.atari.advocacy
Date: 1995-05-03 00:00:00 UTC
From: drichard@execpc.com
Message-ID: <3o6sfb$dct@homer.alpha.net>
Source record: 12804
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy

For Sale: Digidesign Sound Tools system for Atari Mega ST. Note, this system REQUIRES a Mega ST because the DSP board plugs directly onto the Mega ST's bus. I paid over $2000 for this system, and am asking $450 or best offer. It's in very good condition and comes with original manuals, etc. If you're unfamiliar with the system, here's what it does:

The Digidesign Sound Tools system is a hard disk digital audio recording, playback, and editing system. It can be used for mastering CD's, tapes, etc. or for editing digital audio. The system I'm selling consists of the following 3 components:

1) DAT I/O digital interface for doing direct digital audio I/O (entirely in digital domain) from DAT, Mini Disc, DCC, or a CD player that has digital output. It has both AES/EBU and S/P DIF ins/outs. This is a separate box with cable that plugs into the DSP processor described below.

2) The Sound Tools DSP, a Motorola 56001 DSP processor on a 'card' that plugs onto the Mega ST bus. This processor speeds up DSP functions, and allows things like realtime EQ during playback.

3) The Sound Designer II software. This is the software that drives the hardware described above. In addition to recording and playing back digital audio it includes cut and paste editing, scrub editing, EQ, waveform redraw, normalization, regions and playlists, fades and gain changes, smoothing, mixing of sound files, sample rate conversion, and time compression/expansion.

In addition to the components described above I also have final beta copies of the Digidesign MasterList software (For putting together a Master List of several songs with timing, blank space, etc. for a CD or tape).

If interested in this system please reply via Email to drichard@execpc.com.

Thanks,

Dean

After wading through the tons of bullshit childish messages that proliferate from the keyboards of some of the users here, I find myself questioning my efforts. Perhaps this newsgroup can actually come upon some beneficial words to assist me.

I have been in the process of setting up an Atari 8-bit specialty BBS. A place where 8-bit users can trade information, software...whatever. I've laid out the cash for everything except one or two key pieces - most notably, a Black Box (still looking for a seller at a good price) and an R-Time cartridge. Everything else - the phone line, the modem, etc - are in place.

But now I look at this newsgroup and think, why bother? If this newsgroup is a representation of the typical mentality of today's 8-bit Atari users, why would I want to become a part of it - indeed, a supporter of it? I see nearly nothing here of relevance or interest to the 8-bit community. I see lots of mudslinging, name calling, whining, and complaining, and then some people have the audacity to say that this is the type of behaviour that this newsgroup was created for. WRONG! Look up the definition of "advocacy" anywhere and you'll see nothing relating to the actions and deeds of Mr. Sinclap and His Crew.

So folks, you tell me: Is this the type of crap I'm going to see on my BBS? If so, why should I bother opening it? Nobody with an iota of sense or intelligence would want to participate or support in that sort of activity...right?

> I don't mean smearing in terms of gross wipes of ink across the page. Look
> at a straight line printed. you will notice that the edges are blurry &
> wobble a bit. That's smearing.

The dots are bigger than a laser's because it's physically impossible to create an ink droplet as small as a laser can focus. The effect you're talking about is caused by diffusion of the ink into the fibers of the paper, depending on the quality of the paper's surface.
The bottom line is that inkjet printers are very good, laser printers are better, but not by a truly significant amount for most uses.

I see that the Okidata OLE400 has dropped below $400 now, bringing more choices of laser quality closer to that "magical" $300 price level...

BobR

I have a HP DeskJet 520, and the effect of diffusion, even on cheap copier paper is almost undetectable. (I have to say "almost" because while I can't detect it on the output from my printer, I know it's there as part of the way the printer operates.)

With graphics and straight lines, yes.. you might be able to see it.

I seriously doubt most people could tell the difference on a page of text.

What I actually said in full is:-

The mouse type pointing device and the majority of the WIMP interface
basic concepts were developed by the Xerox company (yes the photo-copier
people) an the late sixties/early seventies at their Paulo Alto research
centre. This info actually came to public attention towards the end of the
Apple/Microsoft legal wrangle over who 'owned' WIMP enviroments as a concept.
Neither of them won, I believe Xerox basically made the concept some kind of pu
lic domain 'idea'.

I am not saying that they actually invcented the 'mouse', they
probably used track balls or similar, but you know how James Burke always
liked to connect these things!

James then replied.

No somebody correct me if I am wrong, but nowhere in my posting do I
extoll the virtues of '14-20 keybangs to change into subdirectories'. And what
is this ..."wimp" comment.

I dispare sometimes, you answer a legitimate question with the facts as
you know them and somebody twists the facts!!!.
I suppose it is my own fault for posting into the advocacy newsgroup!!

> ?

On the other hand, we have James Wood, who's done a complete flip-flop 180 degree turnaround and now is vigorously advocating the IBM (in the Atari newsgroup), and is using every means possible to bash the Macintosh (in the Atari newsgroup), Peter Sinclair, and now is bashing the Amiga (in the Atari newsgroup).

I haven't heard much about Atari out of him, except indirectly when he bashed the new Amiga company for trying to do the same things the C-Lab Falcon, Medusa and Eagle folks are trying to do in the Atari market.

So you see, it's not just Peter Sinclair who's stupid, contradictory, nonsensical and irrelevant...

I remember when this used to be an Atari advocacy group... now it's the "ibm.vs.macintosh.vs.amiga.vs.peter.sinclair.and.not.much.about.Atari" group.

As I said before... pretty amusing...

BobR

Programming X software is easy, if you use the right tools - XForms for the sun,
and VXP for Motif. It's easier than doing GEM stuff to be honest.

|> I thought many Atari users were loyal to Atari. Maybe it's less true as each day

Also, in day to day use the falcon is actually faster and more stable than a
mid range PC anyway. Don't flame on this one, I'm not saying that the hardware
is faster, what I'm saying is that the enviroment is faster than Windows by a
a wide margin. The PC world would have been better off with GEOS as the
windowing standard, as it gave much the same functionality as windows, but with
a freakish (for PC software) turn of speed and resource requirements that would
look more at home on your average Atari software.
